# APPENDIX D:
# PROJECT ELEMENTS

**TABLE 1**
**PROJECT ELEMENTS**

| Project Element | Area (sf) |
|---|---|
| ***Phase I (2012 – 2016)*** | |
| *Existing SCMI Facility at Fish Harbor (Terminal Island, Berth 260)* | |
| Site Restoration (Demolition of existing building, warehouse, shop storage, and floating docks) | 57,500 sf |
| *Berths 56 and 57 (SCMI Facility)* | |
| Conversion of existing 46,500-sf transit shed into SCMI research facility | 46,500 sf |
| with approx. 3,600-sf addition (including demolition of existing addition): | 3,600 sf |
| • Faculty office space | 758 sf |
| • Teaching Laboratories | 3,600 sf |
| • Research Laboratories | 13,849 sf |
| • Lab Support Space | 2,300sf |
| • Administrative Suite | 3,381sf |
| • Staff Support Facilities (toilets, showers and lockers for staff) | 1,964 sf |
| • Building Support Facilities (machine shop, storeroom, chemical storage, hazardous waste, etc) | 6,870 sf |
| • Outdoor Teaching/Outreach classroom | 1,997 sf |
| • Outside Storage Space | 6,150 sf |
| • Hallways, Walkways | 5,634 sf |
| Construct Learning Center at Berth 56 (150-seat lecture hall/auditorium, classrooms, public interpretive center, museum with small aquaria) | 11,500 sf |
| **Berths 56 – 57 Subtotal:** | **61,600 sf** |
| *Parking Facilities* | |
| Surface parking adjacent to Berth 56 | 15 spaces |
| *Other Phase I Improvements* | |
| Construction of floating docks for 12 vessel slips adjacent to Berth 57 | 18,500 sf (12 vessel slips) |
| Circulating Seawater System for Berths 57– 60 | new utility |
| Wharf retrofit/repairs for Berths 57–60 | |
| Construction of a public plaza at Berth 57 | 7500 sf |
| **Total New Square Footage Under Phase I** | **80,100 sf** |
| (Does not include removal of existing SCMI facility at Berth 260) | |
| ***Phase II (2013 – 2024)*** | |
| *Berth 58—60* | |
| Conversion Berth 58 Transit Shed space into SCMI and SCMI Partners research facility | 60,000 sf |
| Conversion Berths 59 – 60 Transit Shed space into a marine science business park/incubator space | 70,000 sf |
| Creation of temporary NOAA space within Berth 59-60 Transit Shed[a] | 50,000 sf |
| Provision of temporary berthing space for 2 to 3 NOAA research vessels at Berths 59-60[a] | |
| Development of waterfront café | 280 sf |
| Designation of public plaza/viewing platform at Berth 60 | 4000 sf |
| Relocation of water taxi service facilities to within B.60 vicinity | |
| *Berths 70-71 (Westways)* | |
| Construction of NOAA administration and research facility[b] | 50,000 sf |
| Wharf maintenance (remove catwalks) | |
| Installation of Wave Tank, enclosed within its own building | 80,000 sf (36,000 cy) |
| **Berths 70-71 Subtotal** | **130, 000 sf** |

**TABLE 1**
**PROJECT ELEMENTS**

| Project Element | Area (sf) |
|---|---|
| *Signal Street Improvements*[c] | |
| • Repaving and restriping | |
| • Diagonal parking | 195 spaces |
| • Removal of existing heavy rail line from street | 8,000 square feet of disturbance |
| **Total New Square Footage Under Phase II** | **314,280 sf** |
| **Total New Square Footage for Proposed Project** | **394,380 sf** |
| *Parking Facilities* | |
| • Berth 56 Surface Parking | 15 spaces |
| • Minor Street Diagonal Parking | 195 spaces |
| • Sampson Way and 22nd Street Existing Parking Lot | 409 spaces |
| **Total Parking Spaces** | 619 spaces |

[a] NOAA facilities, including office and research space within Berths 58-60 Transit Shed and berthing space at Berths 58-60 to be relocated to Berths 70-71 when remediation of those berths has been completed.
[b] Demolition of the Westways tanks, piping and related structures at Berths 70-71 has been analyzed under the San Pedro Waterfront EIS/EIR and is not considered a component of the proposed Project.
[c] Impacts associated with extension of Red Car Line construction and expansion of waterfront promenade were considered under the San Pedro Waterfront EIR and are not considered components of the proposed Project.

SIGNAL WARRANT DISCLAIMER
This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

Approach[eastbound][lanes=2][control=Stop Sign]
Signal Warrant Rule #1: [vehicle-hours=0.3]
FAIL - Vehicle-hours less than 5 for two or more lane approach.
Signal Warrant Rule #2: [approach volume=34]
FAIL - Approach volume less than 150 for two or more lane approach.
Signal Warrant Rule #3: [approach count=3][total volume=1889]
SUCCEED - Total volume greater than or equal to 650 for intersection with less than four approaches.

---

SIGNAL WARRANT DISCLAIMER
This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

SIGNAL WARRANT DISCLAIMER

This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

SIGNAL WARRANT DISCLAIMER
This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

FAIL - Approach volume less than 150 for two or more lane approach.
Signal Warrant Rule #3: [approach count=3][total volume=1959]
SUCCEED - Total volume greater than or equal to 650 for intersection with less than four approaches.

---

SIGNAL WARRANT DISCLAIMER
This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

Approach[eastbound][lanes=2][control=Stop Sign]
Signal Warrant Rule #1: [vehicle-hours=0.3]
FAIL - Vehicle-hours less than 5 for two or more lane approach.
Signal Warrant Rule #2: [approach volume=28]
FAIL - Approach volume less than 150 for two or more lane approach.
Signal Warrant Rule #3: [approach count=3][total volume=2185]
SUCCEED - Total volume greater than or equal to 650 for intersection with less than four approaches.

---

SIGNAL WARRANT DISCLAIMER
This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

SIGNAL WARRANT DISCLAIMER

This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

SIGNAL WARRANT DISCLAIMER
This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

Approach[eastbound][lanes=2][control=Stop Sign]
Signal Warrant Rule #1: [vehicle-hours=0.3]
FAIL - Vehicle-hours less than 5 for two or more lane approach.
Signal Warrant Rule #2: [approach volume=32]
FAIL - Approach volume less than 150 for two or more lane approach.
Signal Warrant Rule #3: [approach count=3][total volume=1851]
SUCCEED - Total volume greater than or equal to 650 for intersection with less than four approaches.

---

SIGNAL WARRANT DISCLAIMER
This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

SIGNAL WARRANT DISCLAIMER

This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

Signal Warrant Rule #3: [approach count=4][total volume=1951]
SUCCEED - Total volume greater than or equal to 800 for intersection with four or more approaches.

---

SIGNAL WARRANT DISCLAIMER
This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

SIGNAL WARRANT DISCLAIMER
This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

SIGNAL WARRANT DISCLAIMER
This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

Signal Warrant Rule #2: [approach volume=1]
FAIL - Approach volume less than 100 for one lane approach.
Signal Warrant Rule #3: [approach count=4][total volume=2021]
SUCCEED - Total volume greater than or equal to 800 for intersection with four or more approaches.

---

SIGNAL WARRANT DISCLAIMER
This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

SIGNAL WARRANT DISCLAIMER

This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

SIGNAL WARRANT DISCLAIMER
This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

Signal Warrant Rule #3: [approach count=4][total volume=3736]
SUCCEED - Total volume greater than or equal to 800 for intersection with four or more approaches.

---

SIGNAL WARRANT DISCLAIMER
This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

SIGNAL WARRANT DISCLAIMER

This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

SIGNAL WARRANT DISCLAIMER
This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

Approach[eastbound][lanes=2][control=Stop Sign]
Signal Warrant Rule #1: [vehicle-hours=10.1]
   SUCCEED - Vehicle-hours >= 5 for two or more lane approach.
Signal Warrant Rule #2: [approach volume=64]
   FAIL - Approach volume less than 150 for two or more lane approach.
Signal Warrant Rule #3: [approach count=4][total volume=3980]
   SUCCEED - Total volume greater than or equal to 800 for intersection
             with four or more approaches.
--------------------------------------------------------------------------------
Approach[westbound][lanes=1][control=Stop Sign]
Signal Warrant Rule #1: [vehicle-hours=0.0]
   FAIL - Vehicle-hours less than 4 for one lane approach.
Signal Warrant Rule #2: [approach volume=1]
   FAIL - Approach volume less than 100 for one lane approach.
Signal Warrant Rule #3: [approach count=4][total volume=3980]
   SUCCEED - Total volume greater than or equal to 800 for intersection
             with four or more approaches.
--------------------------------------------------------------------------------
SIGNAL WARRANT DISCLAIMER
This peak hour signal warrant analysis should be considered solely as an
"indicator" of the likelihood of an unsignalized intersection warranting
a traffic signal in the future.  Intersections that exceed this warrant
are probably more likely to meet one or more of the other volume based
signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace
a rigorous and complete traffic signal warrant analysis by the responsible
jurisdiction.  Consideration of the other signal warrants, which is beyond
the scope of this software, may yield different results.

SIGNAL WARRANT DISCLAIMER

This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

Signal Warrant Rule #2: [approach volume=2]
FAIL - Approach volume less than 100 for one lane approach.
Signal Warrant Rule #3: [approach count=4][total volume=4276]
SUCCEED - Total volume greater than or equal to 800 for intersection with four or more approaches.

---

SIGNAL WARRANT DISCLAIMER
This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

SIGNAL WARRANT DISCLAIMER
This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

Signal Warrant Rule #1: [vehicle-hours=4.8]
FAIL - Vehicle-hours less than 5 for two or more lane approach.
Signal Warrant Rule #2: [approach volume=47]
FAIL - Approach volume less than 150 for two or more lane approach.
Signal Warrant Rule #3: [approach count=4][total volume=3537]
SUCCEED - Total volume greater than or equal to 800 for intersection with four or more approaches.

---

Approach[westbound][lanes=1][control=Stop Sign]
Signal Warrant Rule #1: [vehicle-hours=0.0]
FAIL - Vehicle-hours less than 4 for one lane approach.
Signal Warrant Rule #2: [approach volume=1]
FAIL - Approach volume less than 100 for one lane approach.
Signal Warrant Rule #3: [approach count=4][total volume=3537]
SUCCEED - Total volume greater than or equal to 800 for intersection with four or more approaches.

---

SIGNAL WARRANT DISCLAIMER
This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

SIGNAL WARRANT DISCLAIMER

This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

# SPECIAL-STATUS SPECIES

## SPECIAL-STATUS SPECIES BIOLOGY AND LIKELIHOOD OF OCCURRENCE ANALYSIS

The following information provides explanation for conclusions regarding likelihood of occurrence. The brief synopses of biology are provided as limited background only, and no attempt is made to compile or summarize all potentially relevant information on the species.

This appendix addresses all species with applicable special regulatory or management status that includes the Project study area within their general range and for which grossly appropriate habitat is present on or near the Project study area. Conclusions here are limited to biology, with no reflection of regulatory or management issues. For interpretation of this information under applicable laws, regulations and court precedent, see the relevant portion(s) of the report. Judgments regarding likelihood of occurrence are based on evaluation of all available biological information regarding regional and local conditions, species biology, available evaluations of the Project study area and vicinity, and professional experience conducting field investigations across California over many years.

Specific factors substantially affect likelihood of occurrence for individual species on any particular study area. These factors are relevant at multiple scales, including regionally, locally, and within the Project study area. These factors include the presence or absence of many other particular species (e.g., predators, prey), climate, ongoing disturbances, historical land use and other past disturbances such as fire history, surface and subsurface hydrology, soil texture and chemistry, Project study area and habitat size and topology (i.e., shape and fragmentation), past population fluctuations of the species in response to random and nonrandom events, and many other factors, including many not readily visible. Note that some species, including many birds and bats, can occur in multiple roles. Thus, likelihood of occurrence, habitat use, and abundance may vary accordingly. Where multiple codes are given for a species, underlined codes refer to the likelihood of occurrence in potentially constraining roles (e.g., breeding, as opposed to migration or dispersal, for many state Species of Special Concern birds).

## TERMS FOR LIKELIHOOD OF OCCURRENCE IN THE PROJECT STUDY AREA

**NONE**: Based on available information, it is judged that the species does not occur. This determination is based on some combination of these facts: (1) the Project study area is clearly outside the current range based on available information, and/or (2) the Project study area does not contain suitable or extensive enough habitat (including any adjacent off-Project study area habitat) to hold the species or confirmed to be absent based on negative results of a focused survey for the species conducted in appropriate habitat at appropriate time(s) of year, using biologically sound methods and qualified personnel. Further evaluation should not be required at this time.

**VERY LOW**: Although remotely possible, the probability of occurrence on the Project study area is almost none, and the likelihood of meaningful use is less than reasonable. The species may include the Project study area within its general range, however, no appropriate or adequately extensive habitat is found (either on or immediately adjacent to the Project study area). Neither the species nor any indication of its presence was detected. In some cases this likelihood may indicate that based on the best available information, the Project study area has a very high probability of being outside of the species' current range. In all of these cases, the species cannot be definitively ruled out, but is strongly expected to be absent based on the best available evidence. In some cases, the species may occur on rare occasions and in very low numbers, but such stray individuals are unlikely to make more than very brief, incidental use of the Project study area. Certainly there are no substantial populations utilizing the Project study area at any time of year. Further evaluation should not normally be required.

**LOW**: The species is unlikely because of some combination of facts: (1) it was the subject of unsuccessful searches conducted under reasonable circumstances, (2) only marginal or minimal habitat is present, (3) the best available information suggests the species is absent from the Project study area, and/or (4) available information sheds no clear light on the species likelihood on the Project study area, but it is known to be rare at best in the vicinity. No individuals were detected, nor is there any direct indication of them. Although individuals may have been missed, it is unlikely that substantial populations are present. Further evaluation should usually not be required for individual species except, in most cases, for threatened or endangered species. Note however, that where several non-listed species hold this status, a much higher likelihood of occurrence for "one or more" will generally hold. This is due both to the increased number of species, and the fact that an array of possibilities often correlates with greater alpha diversity and lower actual disturbance levels.

**MODERATE**: The Project study area is within the range of the species, and appears to contain appropriate habitat. No individuals or diagnostic sign were detected, it is nevertheless reasonable that some individuals have been overlooked. The best available information on the species with regard to the Project study area is either very uncertain, or is about equally weighted for and against occurrence. Depending upon local and special legal status, extent of habitat, and the nature and sensitivity of the project, focused surveys for the species may be warranted or presence may be assumed.

**HIGH**: The Project study area is known to be within the range of the species, and appears to contain habitat with substantial potential for occupancy. Although no individuals or diagnostic sign were detected, it is judged likely that it is present to some degree, given the best available information. Depending upon regulatory status, local rarity, public interest, extent of habitat on the Project study area and the nature of potential project impacts, a substantial basis may exist for either conducting focused surveys for the species or for assuming presence.

**VERY HIGH**: Based on the best available information, the Project study area is within the current range of the species and sufficient very appropriate or characteristic habitat is present on or contiguous with the Project study area for occupancy. Although individuals and/or diagnostic sign were not definitely detected at the current time, it is judged to be very highly likely to occur. In some cases the species may be known to have occurred on the Project study area historically or in the recent past, with no clear basis to assume extirpation since then. In rare cases, changes off of the Project study area (e.g., fire or other disturbance) may provide a basis to assume current presence as a result. Although focused surveys for this species would be required to absolutely confirm presence or absence, such surveys are judged to have a very high probability of confirming presence. Without such surveys presence should generally be assumed.

**CONFIRMED**: Confirmed present by a qualified biologist or other highly reliable source and there is no specific evidence that the species is now absent. Depending on the species and other information available, it may or may not be possible to determine what portions of the Project study area are currently in use without further studies.

**ABSENT**: Confirmed to be absent on the Project study area as a practical matter. Most often, this is a determination based on negative results of a focused survey for the species conducted in appropriate habitat at appropriate time(s) of year, using biologically sound methods and qualified personnel. In the remaining cases, it may be based on a simple Project study area examination, for species and Project study area contexts where it is easily determined that the species is absent; for example, a tidal marsh insect and a dry mountainside Project study area, or a disturbance-intolerant chaparral shrub where the Project study area is a long-standing, degraded grassland far from chaparral. The relevant field work was also in all cases conducted within a time frame sufficiently recent to conclude that the species remains absent, based on Project study area conditions and the species' known ecology. In most cases a specific, established survey protocol and/or guidelines have been followed.

**Table 1. Status Code Explanations**

| Status code | Explanation |
|---|---|
| FE | Federally Endangered |
| FT | Federally Threatened |
| FPE | Federally proposed Endangered |
| FPT | Federally proposed Threatened |
| FC | Federal Candidate species |
| FW | Federally "warranted for listing, but listing is precluded by higher priority actions" |
| EPA | Covered under the Federal "Bald and Golden Eagle Protection Act" |
| SE | State Endangered |
| ST | State Threatened |
| SR | State Rare (used for plants only) |
| SCE | State Candidate for Endangered listing |
| SCT | State Candidate for Threatened listing |
| SSC | State Species of Special Concern |
| CFP | California Fully Protected species |
| CSP | California Specially Protected species |
| CNDDB | Tracked by the California Department of Fish and Game "Natural Diversity Data Base", but with no other special regulatory or management status |
| 1A | California Native Plant Society (CPS) List 1A plant ("Plants presumed extinct in California") |
| 1B | CNPS List 1B plant ("Plants rare, threatened or endangered in California and elsewhere") |
| 2 | CNPS List 2 plant ("Plants rare, threatened or endangered in California, but more common elsewhere") |
| P | "pt" or "pd": the taxon has been formally proposed to be down-listed, either from Endangered to Threatened ("pt"), or delisted completely ("pd") |

**Table 2. Special Status Species Information**

| SPECIES / NATURAL COMMUNITIES[1] | SPECIAL STATUS[2] | OCCURRENCE[3] LIKELIHOOD | COMMENTS[4] |
|---|---|---|---|
| **PLANTS** | | | |
| Aphanisma (*Aphanisma blitoides*) | 1B | None | Annual herb; habitat includes sandy soils in coastal bluff scrub, coastal dunes, coastal scrub at 1 to 305 meters elevation. These types of vegetation communities are absent from the Project study area. |
| South Coast Saltscale (*Atriplex pacifica*) | 1B | None | Annual herb; habitat includes coastal bluff scrub, coastal dunes, coastal scrub, and playas at 0 to 140 meters elevation. These habitats are absent from the Project study area. |
| Parish's Brittlescale (*Atriplex parishii*) | 1B | None | Not recorded in the San Pedro quadrangle; annual herb; associated with chenopod scrub, playas, and vernal pools at 25 to 1900 meters elevation. Such habitats are absent from the Project study area. |
| Davidson's Saltscale (*Atriplex serenana* var. *davidsonii*) | 1B | None | Annual herb; found in alkaline soils within coastal bluff scrub and coastal scrub vegetation communities at 10 to 200 meters elevation. Habitat absent from Project study area. |
| Lewis's Evening-Primrose (*Camissonia lewisii*) | 3 | None | Not recorded in the San Pedro quadrangle; annual herb found in sandy and clay soils of coastal bluff scrub, cismontaine woodland, coastal dune, coastal scrub, and valley and foothill grassland at 0 to 300 meters elevation. No such habitats are present within the Project study area. |
| Southern Tarplant (*Centromadia parryi* ssp. *australis*) | 1B | None | Not recorded from the San Pedro quadrangle; an annual herb found at the margins of marshes and swamps, in mesic valley and foothill grasslands, and vernal pools at elevations of 0 to 425 meters. No potentially suitable habitat is present within the Project study area. |
| Orcutt's Pincushion (*Chaenactis glabriuscula* var. *orcuttiana*) | 1B | None | Not recorded in the San Pedro quadrangle; annual herb found in sandy soils associated with coastal bluff scrub and coastal dunes at elevations of 0 to 300 meters. No habitat is present within the Project study area. |
| Salt Marsh Bird's-Beak (*Cordylanthus maritimus* ssp. *maritimus*) | FE, SE, 1B | None | Not recorded within the San Pedro quadrangle; annual herb that is found in coastal dunes and coastal salt marshes and swamps at 0-30 meters elevation. A small amount of coastal salt marsh is present Cabrillo. Although historically this area was an expansive saltmarsh/mudflat complex prior to World War II, all that remains is the 3.25-acre Cabrillo salt marsh that was constructed in 1982 (Los Angeles Harbor Department and EDAW, Inc. 1982. Cabrillo Salt Marsh Construction, p. 101- |

| SPECIES / NATURAL COMMUNITIES[1] | SPECIAL STATUS[2] | OCCURRENCE[3] LIKELIHOOD | COMMENTS[4] |
|---|---|---|---|
| | | | 102. In M. Josselyn (Ed.), Wetland Restoration and Enhancement in California. Report T-CSGCP-007, California Sea Grant College Program, University of California, La Jolla). Given the historical disturbances to the area, relative isolation, and artificial construction of marsh, no potential for the species is judged present. |
| Catalina Crossosoma (*Crossosoma californicum*) | 1B | None | Not recorded from San Pedro quadrangle; perrential deciduous shrub found in rocky chaparral and coastal scrub at elevations of 0 to 500 meters. No potential habitat is present within the Project study area. |
| Beach Spectaclepod (*Dithyrea maritima*) | 1B | None | Not found w/in San Pedro quadrangle; perennial herb that is associated with coastal dunes and coastal scrub at 3 to 50 meters elevation. No habitat present in Project study area. |
| Island Green Dudleya (*Dudleya virens* ssp. *insularis*) | 1B | None | Not recorded from San Pedro quadrangle; perennial herb found in rocky coastal bluff scrub and coastal scrub at elevations of 5 to 300 meters. Potential habitat absent from Project study area. |
| Coulter's Goldfields (*Lasthenia glabrata* ssp. *coulteri*) | 1B | None | Not recorded from San Pedro quadrangle; annual herb that inhabits coastal salt marshes and swamps as well as playas and vernal pools at elevations of 1 to 1220 meters. Only extant salt marsh present w/in the vicinity of the Project study area is at Cabrillo. This marsh was created in 1982 and given the time lapse between historical wetlands to the area (prior to World War II) and the isolated conditions of the created Cabrillo salt marsh, no potential for the species is judged present. Vernal pools and playas are absent from the Project study area. |
| Santa Catalina Island Desert-Thorn (*Lycium brevipes* var. *hassei*) | 1B | None | Not recorded from the San Pedro quadrangle; perennial deciduous shrub found at elevations of 10 to 300 meters w/in coastal bluff scrub and coast scrub. No potential habitat is present w/in the Project study area. |
| Prostrate Navarretia (*Navarretia prostrata*) | 1B | None | Not recorded from San Pedro quadrangle; annual herb found in coastal scrub, meadows and seeps, valley and foothill grasslands, and vernal pools; typically associated with alkaline soils and mesic soil conditions at 15 to 700 meters elevation. Single record for species w/in geographical region is dated 1882 and from Wilmington (CDFG 2005). In addition, the freshwater marsh located at the 22nd Street/Old Tank Farm Land open space is far too degraded and disturbed to provide potentially suitable habitat for this species. Soils adjacent to the marsh are compacted and have been "amended" with asphalt, concrete, and gravel. |
| Coast Woolly-heads (*Nemacaulis denudata* var. *denudata*) | 1B | None | Not recorded from San Pedro quadrangle; annual herb found at 0 |

| SPECIES / NATURAL COMMUNITIES[1] | SPECIAL STATUS[2] | OCCURRENCE[3] LIKELIHOOD | COMMENTS[4] |
|---|---|---|---|
| | | | to 100 meters elevation in coastal dunes. Habitat absent from the Project study area. |
| Lyon's Pentachaeta (*Pentachaeta lyonii*) | FE, SE, 1B | None | Not recorded for San Pedro quadrangle; annual herb associated with chaparral, coastal scrub, and valley and foothill grasslands at 30 to 630 meters elevation. No potential habitat w/in Project study area. |
| Brand's Phacelia (*Phacelia stellaris*) | 1B | None | Not recorded from the San Pedro quadrangle; annual herb found at 1 to 400 meters elevation w/in coastal scrub and dunes. No potential habitat present w/in Project study area. |
| Estuary Seablite (*Suaeda esteroa*) | 1B | None | Not recorded w/in San Pedro quadrangle; perennial herb found in coastal salt marshes and swamps at elevations of 0 to 5 meters. Only extant salt marsh is at Cabrillo. This marsh was created in 1982 and isolated from other salt marshes. Given the conditions by which the marsh was created along with it being isolated, the species is judged absent from the Project study area. |
| **ANIMALS** | | | |
| Palos Verdes Blue Butterfly (*Glaucopsyche lygdamus palosverdesensis*) | FE | None | Species limited to a single small population at the former Palos Verdes Navy Housing Area located directly north of the Defense Fuel Supply Point in San Pedro. Associate w/ coastal sage scrub. Potential habitat absent from Project study area and species not known from other locations. |
| Monarch Butterfly (*Danaus plexippus*) | CNDDB | Moderate as migrant only. | Winter roost sites extend along the coast from northern Mendocino to Baja California. Roosts located in wind-protected tree groves (gum trees, Monterey pines, cypress) with nectar and water sources nearby. Small numbers expected to migrate through Project study area in fall. No potential roost sites w/in Project study area. |
| Tidewater Goby (*Eucuclogobius newberryi*) | FE, SSC | None | Historically, the Los Angeles basin provided shallow, brackish lagoon habitat suitable for the tidewater goby. Currently, however, this area is a gap between the Santa Monica (in western L.A. County) and Alisa Creeks (in Orange County) populations (USFWS 2004 – Andy Wones citation). The Project study area contains no habitat suitable for the species and there is no designated federal Critical Habitat for this species (Federal Register 65(224:69693-69717) in the Project study area. |
| Green Sea Turtle (*Chelonia mydas*) | FT | Very Low as transient | Has been observed sporadically in the Los Angeles/Long Beach Harbor area (http://www.mxsocal.org/oldweb/hspappendh.htm). |
| Leatherback Sea Turtle (*Dermochelys coriacea*) | FE | Very Low as transient | Has been observed sporadically in the Los Angeles/Long Beach Harbor area (http://www.mxsocal.org/oldweb/hspappendh.htm). |
| Loggerhead Sea Turtle (*Caretta caretta*) | FT | Very Low as transient | Has been observed sporadically in the Los Angeles/Long Beach Harbor area (http://www.mxsocal.org/oldweb/hspappendh.htm). |

| SPECIES / NATURAL COMMUNITIES[1] | SPECIAL STATUS[2] | OCCURRENCE[3] LIKELIHOOD | COMMENTS[4] |
|---|---|---|---|
| Olive Ridley (*Lepidochelys olivacea*) | FT | Very Low as transient | Has been observed sporadically in the Los Angeles/Long Beach Harbor area (http://www.mxsocal.org/oldweb/hspappendh.htm). |
| San Diego Coast Horned Lizard (*Phrynosoma coronatum blainvillei*) | SSC, | None | Inhabits coastal sage scrub and chaparral in arid and semi-arid climate conditions; prefers friable, rocky, or shaley sandy soils. Potential habitat absent from Project study area. |
| Common Loon (*Gavia immer*) | SSC | Confirmed as migrant and winter resident only | Southern California outside species breeding range; species has been documented w/in the Project study area during fall, winter, and spring (MEC 2002 - Analytical Systems, Inc. 2002. Ports of Long Beach and Los Angeles Year 2000 Biological Baseline Study of San Pedro Bay. Prepared for Port of Los Angeles, Planning Division. Carlsbad, CA. June). |
| California Brown Pelican (*Pelecanus occidentalis californicus*) | FE, SE, CFP | Confirmed as year-round non-breeder | Species uses the Harbor for foraging and roosting only; breeds on the Channel Islands and islands off the coast of Baja California (LAHD 2004 – Draft EIR for Berth 206-209, Interim Container Terminal Reuse Project. Prepared with assistance from CH2MHILL, Santa Ana, California. May 2004). |
| Double-crested Cormorant (*Phalacrocorax auritus*) | SSC | Confirmed as year-round non-breeder | This colonial piscivore (fish eater) is an uncommon transient and winter resident in coastal southern California, especially at major rivers and lakes with undisturbed shallows. Species is known to forage and roost w/in the Harbor year-round. Breeds along the coast and on the Channel Islands in undisturbed settings. |
| Osprey (*Pandion haliaetus*) | SSC | Confirmed as migrant and wintering resident non-breeder | Diet consists almost entirely of fish. It was formerly a common and widespread breeder in southern California (Grinnell and Miller 1944 - Grinnell, J., and A. H. Miller. 1944. The Distribution of the Birds of California. Pacific Coast Avifauna 27.), but no longer breeds regularly in California anywhere south of the northern San Francisco Bay (Small 1994 - Small, A. 1994. California Birds: Their Status and Distribution. Ibis Publishing Company, Vista, CA. 342 pp.). Declines are directly attributed to environmental pollution, with secondary causes including harassment by fishermen, disturbance at nest sites, and loss of habitat quality (including increased turbidity and fish stock declines in some rivers). Species is known to forage in Harbor waters for fish and roosts on tall undisturbed poles, tree snags, etc. |
| White-tailed Kite (*Elanus leucurus*) | CFP | Low as migrant; non-breeder | A bird of prey that hunts in open country. It is found across most of California. Nests are located low in trees and large shrubs near foraging areas in savannahs and at edges between open habitat and woodland or forest areas; vulnerable to human disturbance, especially during nesting. Species is not recorded for the Harbor and is not likely to occur except as a rare brief |

| SPECIES / NATURAL COMMUNITIES[1] | SPECIAL STATUS[2] | OCCURRENCE[3] LIKELIHOOD | COMMENTS[4] |
|---|---|---|---|
| | | | migrant. |
| Bald Eagle (*Haliaeetus leucocephalus*) | FT, EPA, SE, CFP | Very Low as migrant non-breeder | Species eats mainly fish and carrion, and formerly nested locally along the coast of southern California. It is now a very localized winter resident and rare migrant, with only very rare breeding efforts in coastal southern California (e.g., Lake Skinner, Riverside County). Within Los Angeles Harbor an individual may occur in some years during migration and/or winter. Coastally the species is known to nest on Santa Catalina Island. |
| Sharp-shinned Hawk (*Accipiter striatus*) | SSC | Low as non-breeding migrant | This small raptor specializes in hunting small birds and winters widely and fairly commonly in California including urban settings. It is a rare breeder south of northern San Luis Obispo County, and then only in high elevation forest and riparian habitats. Within the Project study area this species is likely to occur sporadically as a migrant or winter visitor. |
| Cooper's Hawk (*Accipiter cooperii*) | SSC | Low as non-breeding migrant | This medium sized hawk is a specialist in hunting small birds in closed quarters. It winters widely and fairly commonly in California as birds breeding to the north move in. In southern California Cooper's Hawks breed primarily in woodland habitats, especially riparian zones, but also oak woodland, walnut woodland, gumtrees (*Eucalyptus* spp.), and occasionally in dense, abandoned or otherwise undisturbed orchards. Within the Project study area this species would likely be an uncommon visitor. |
| Merlin (*Falco columbarius*) | SSC | Low as non-breeding migrant | This is a falcon which breeds only to the north and east of California and winters here sparsely. Like larger falcons such as peregrine falcon, merlins specialize in hunting birds in open country, especially wetlands and extensive grasslands next to trees. Within the Project study area it is reasonable that this species could occur uncommonly as migrant and/or brief winter visitor. |
| American Peregrine Falcon (*Falco peregrinus anatum*) | SE, CFP | Confirmed | This subspecies of peregrine falcon formerly bred over most of North America. It was listed as a federally endangered species on 13 October 1970, and as state endangered on 27 June 1971. The species is currently undergoing a slow, steady recovery, and again breeds in small numbers through much of non-desert portions of California. Habitat at all seasons is primarily areas with accessible open water and high densities of prey species such as ducks and shorebirds. The American peregrine falcon was formally delisted under the federal Endangered Species Act on 25 August 1999 (USFWS 1999 - U.S. Fish and Wildlife Service. 1999. Endangered and Threatened Wildlife and Plants: |

| SPECIES / NATURAL COMMUNITIES[1] | SPECIAL STATUS[2] | OCCURRENCE[3] LIKELIHOOD | COMMENTS[4] |
|---|---|---|---|
| | | | Final Rule to Remove the American Peregrine Falcon from the List of Federal Endangered and Threatened Wildlife, and to Remove the Similarity of Appearance Provision for Free-flying Peregrines in the Conterminous United States; Final Rule. Fed. Reg. 64:46542-46558. 25 August 1999.), as were individuals of all other subspecies occurring within the range of this subspecies. The species as a whole remains listed as Endangered at the state level, throughout California. This species is known to nest within Los Angeles and Long Beach Harbors. The nearest known nesting location to the Project study area is the Vincent Thomas Bridge and the species may forage any where waterbird and pigeons concentrate and thus, may range widely when foraging. |
| Light-footed Clapper Rail (*Rallus longirostris levipes*) | FE, SE | None | This subspecies of clapper rail is restricted to the lower elevations of coastal marshes with active tidal flow. No substantial seasonal movements occur, although rare individuals wander away from known breeding locales. The population trend at this time is uncertain, but nearly all remaining populations are vulnerable to extirpation due to nonnative predators, human disturbance, poor water quality (especially due to siltation of marshes from upland runoff), and habitat degradation and loss. Within the Project study area the only possible location for the species is the Cabrillo salt marsh. The marsh vegetation w/in Cabrillo is far too small to support a clapper rail. This species is judged absent from the Project study area. |
| Western Snowy Plover (*Charadrius alexandrinus nivosus*) | FT, SSC | Confirmed as non-breeder | Breeding habitat requirements include open, relatively flat areas with little or no vegetation. This includes undisturbed beaches, salt flats, playas, dredge spoils, levees, and even river bars. Food is virtually all aquatic and terrestrial invertebrates, which is typically captured through active observation, running, and then gleaning from the ground surface of tidal mudflats. Causes of decline are loss and, especially, intensive human disturbance of nesting areas, and introduction of nonnative predators. The federal listing of Threatened applies only to populations less than 50 miles from the nearest point of the Pacific Ocean. Along the southern California coastline this species is much more "common" as a migrant and winter visitor than a breeder where it can be found foraging and roosting along undisturbed beaches, lagoons, and estuaries. Within the Harbor this species is an occasional visitor to Pier 400 during the tern breeding season (May through August) (Keane Biological Consulting 2004 – |

| SPECIES / NATURAL COMMUNITIES[1] | SPECIAL STATUS[2] | OCCURRENCE[3] LIKELIHOOD | COMMENTS[4] |
|---|---|---|---|
| | | | Keane Biological Consulting. Final Report Breeding Biology of the California Least Tern in Los Angeles Harbor 2004 Season. Prepared for Los Angeles Harbor Department, Environmental Management Division. January 2005) with use of the Project study area expected to be limited to beach and mudflat habitats for foraging and roosting and rare. |
| Long-billed Curlew (*Numenious americanus*) | SSC | Confirmed as non-breeding migrant/winter visitor | Within southern California, this species occurs as a spring/fall migrant and/or winter visitor along beaches and mudflats. This species is known to occur w/in the Harbor as an infrequent transient. |
| California Gull (*Larus californicus*) | SSC | Confirmed as non-breeder | This gull breeds in large colonies east of the Sierra Nevada mountains and in San Francisco Bay, and is one of about a dozen species of "seagulls" that winter in and migrate through coastal southern California. Concentrations occur along the coast, major rivers, lakes, open landfills, and at parks with duck ponds. This species is confirmed to occur as a non-breeder within the Project study area with highest numbers during fall/spring and winter. This species is expected to forage and roost within the Study Area. |
| Black Skimmer *(Rynchops niger*) | SSC | Confirmed as breeder | This species breeds at Pier 400 in small numbers (Keane Biological Consulting - Keane Biological Consulting. Final Report Breeding Biology of the California Least Tern in Los Angeles Harbor 2004 Season. Prepared for Los Angeles Harbor Department, Environmental Management Division. January 2005) and is expected to forage within the Study Area. This bird skims along surface coastal waters for fish and can be seen feeding along quiet protected waters as well as open nearshore waters. Based on MEC (2002 - Analytical Systems, Inc. 2002. Ports of Long Beach and Los Angeles Year 2000 Biological Baseline Study of San Pedro Bay. Prepared for Port of Los Angeles, Planning Division. Carlsbad, CA. June) this species is most common to the Harbor in July and August when post-breeding dispersal from larger breeding colonies occurs along the coast is expected to occur. The lowest number of individuals was recorded in May-June and October-January. |
| California Least Tern (*Sterna antillarum browni*) | FE, SE, CFP | Confirmed as breeder | This subspecies of least tern historically bred in scattered, mostly small colonies along the coast from Monterey Bay south into Baja California. Today they breed in far fewer colonies, heavily managed to control predators and human disturbance, from San Francisco Bay (Alameda County) south to a few sites along the Pacific Coast of Baja California, Mexico. Most individuals breed at a few relatively large colonies in coastal southern |

| SPECIES / NATURAL COMMUNITIES[1] | SPECIAL STATUS[2] | OCCURRENCE[3] LIKELIHOOD | COMMENTS[4] |
|---|---|---|---|
| | | | California including Pier 400 in Los Angeles Harbor. They are extremely rare more than a few miles offshore, or inland except for occasional foraging at favorable fresh and brackish water locations. Winter distribution is unknown, but presumed to be open ocean off of Central America or South America; there are no winter records for California. The species feeds by diving for small surface fish from in flight. The U.S. Fish and Wildlife Service designates the breeding window as 15 April through 15 September; occasional individuals are seen as early as the beginning of April. Colonies are located near the ocean shoreline (within 0.5 miles [about 800 meters]), typically on nearly flat, loose sandy substrates with lightly scattered short vegetation and debris, although some colonies have been located on hard-packed surfaces, even unused asphalt. Colony sites must provide access to the shoreline for juveniles, and must be relatively free of predators. Documented predators include an extremely wide range of hawks, falcons, owls, shrikes, and mammals, even including herons and ground squirrels. The species is vulnerable due to their colonial nesting in a conspicuous, frequently disturbed habitat, along with their small size and dependence on small fishes whose populations vary greatly from year to year. Threats include loss and degradation of nesting and foraging habitat, direct disturbance from humans and pets, and increased predation risks due to the introduction of nonnative predators and increasing reliance on a few large colonies rather than many small, less conspicuous sites. With intensive management, recent population trends are upward. In 2004, an estimated 951 pairs of least terns nested at Pier 400 with 1,042 nests documented. In general, breeding success at this colony is above average compared to other colonies within Los Angeles and Orange Counties. Although the breeding colony is technically just outside the Project study area this species is expected to heavily use the aquatic environs w/in the Project study area for foraging from April through August. |
| Elegant Tern (*Sterna elegans*) | SSC | Confirmed as breeder | This tern forages in coastal and offshore waters including nearshore, bay, and estuarine situations where it feeds strictly on fish by aerial predation. Within the Harbor, elegant's breed at Pier 400 with an estimated 10, 170 nests recorded in 2004 (Keane Biological Consulting 2004 - Keane Biological Consulting. Final Report Breeding Biology of the California Least Tern in Los Angeles Harbor 2004 Season. Prepared for Los Angeles Harbor Department, Environmental Management |

| SPECIES / NATURAL COMMUNITIES[1] | SPECIAL STATUS[2] | OCCURRENCE[3] LIKELIHOOD | COMMENTS[4] |
|---|---|---|---|
| | | | Division. January 2005.). The Harbor in the vicinity of the Project study area is expected to provide important forage for breeding adults and dispersing juvenile. The species is expected to occur between April through October but individuals can be seen in most months. |
| Tufted Puffin (*Fratercula cirrhata*) | SSC | Confirmed as non-breeder (rare) | This seabird is a rare occurrence within southern California coastal waters but an individual was recorded in 2000 (MEC 2002 - Analytical Systems, Inc. 2002. Ports of Long Beach and Los Angeles Year 2000 Biological Baseline Study of San Pedro Bay. Prepared for Port of Los Angeles, Planning Division. Carlsbad, CA. June.). Any sighting of this species is expected to be a rare occurrence. |
| Burrowing Owl (*Athene cunicularia*) | SSC | Confirmed as non-breeder at Pier 400; None w/in Project study area. | This small owl is unusual among birds of prey in utilizing underground burrows. Burrowing owls are widely but thinly scattered through much of the western United States into southern Canada, with a disjunct population in Florida and the Caribbean. Generally they use burrows already dug by fossorial mammals such as ground squirrels, but can also use natural cavities and even man-made structures, such as piles of concrete or openings at the base of structures. Declines have been due to a variety of factors, including direct persecution, habitat loss, and control of both prey species and animals that create burrows. Within the Harbor an individual burrowing owl was relocated from Pier 400 in 2004 (Keane Biological Consulting 2004 - Keane Biological Consulting - Final Report Breeding Biology of the California Least Tern in Los Angeles Harbor 2004 Season. Prepared for Los Angeles Harbor Department, Environmental Management Division. January 2005.). During the current field work for the project, the open lands within the Project study area were carefully checked for potential habitat including ground squirrel burrows. Based on current conditions within the Project study area, potential habitat is absent. |
| Vaux's Swift (*Chaetura vauxi*) | SSC | High | Swifts spend most of their lives in flight, hunting small insects. Vaux's swifts nest in snags in old growth forests from central California to southeast Alaska (as well as in Mexico southward), and winter from central Mexico to northern South America. They are fairly common as spring and fall migrants in southern California. Within the Project study area this species is expected to occur occasionally in fall and spring when the species is migrating to southern wintering grounds or northern breeding ground. |

| SPECIES / NATURAL COMMUNITIES[1] | SPECIAL STATUS[2] | OCCURRENCE[3] LIKELIHOOD | COMMENTS[4] |
|---|---|---|---|
| Loggerhead Shrike (*Lanius ludovicianus*) | SSC | Confirmed | This species typically hunts in sparsely vegetated lands with perches for scanning, and fairly dense shrubs/brush for nesting (Small 1994 - Small, A. 1994. California Birds: Their Status and Distribution. Ibis Publishing Company, Vista, CA. 342 pp.). An individual was recorded during the current field work for the project at the 22nd Street/Old Tank Farm Land open space. It is likely that a pair of this species nests within the brush lining the adjacent cliffs and forages in the remaining open lands within the close vicinity. |
| California Horned Lark (*Eremophila alpestris actia*) | SSC | Confirmed | Species nests in grasslands interrupted by bare ground, dunes, grassy hillsides, mesas, plowed agricultural land, and alkali flats to name a few (Small 1994 - Small, A. 1994. California Birds: Their Status and Distribution. Ibis Publishing Company, Vista, CA. 342 pp) and can be seen year-round in similar habitats including beaches. Several individuals were observed at the 22nd Street/Old Tank Farm Land open space during the current field work and it is expected to occur at other open space w/in the Project study area. It is also expected to breed in small numbers in these same areas. |
| Coastal California Gnatcatcher (*Polioptila californica californica*) | FT, SSC | None | This species is an "obligate" resident of coastal sage scrub. No potential habitat within or adjacent to the Project study area. |
| Western Yellow Warbler (*Dendroica petechia brewsteri*) | SSC | Moderate as non-breeding migrant | Within the southern California coastal zone, breeding habitat for this warbler is found in riparian woodlands. Although the breeding habitat for this species is riparian, migrant yellow warblers during spring and fall can be found in a wide variety of habitats ranging from arid coastal sage scrub to urban landscaping (e.g., gum trees). Within the Project study area this species is expected to be limited to migrants in spring and summer and only a small number of individuals are expected. No breeding habitat is present. |
| Belding's Savannah Sparrow (*Passerculus sandwichensis beldingi*) | SE | Confirmed transient visitor | This subspecies of savannah sparrow is a locally common non-migratory resident of coastal saltmarsh. It is distributed from northwestern Baja California north to Santa Barbara County. This subspecies was formerly numerous and widespread within this restricted range, as noted by Willett (1912): "Abundant resident of the salt marshes along the coast". In some places it extends inland into alkaline marshes as much as 8 miles (about 12.9 kilometers), but all known localities are within 100 feet (about 30.5 meters) elevation above mean sea level. It is an obligate breeder in middle elevation saltmarsh, nearly always characterized by pickleweed (Salicornia spp.), either in tidal situations or non-tidal alkaline flats nearby. Although the |

| SPECIES / NATURAL COMMUNITIES[1] | SPECIAL STATUS[2] | OCCURRENCE[3] LIKELIHOOD | COMMENTS[4] |
|---|---|---|---|
| | | | majority of its subsistence stems from the saltmarsh and closely adjacent mudflat, individuals, particularly post-breeding birds, can be found foraging in a wide variety of habitats including upper marsh, adjacent ruderal and ornamental vegetation, open beach and mudflat, and even dirt and gravel parking lots. During fall, winter and spring, several other races of Savannah Sparrow occur in the same areas as Belding's, with complete overlap in habitat use (though the migrants remain more common in uplands). Migrants may be present within the range of Belding's from at least late August through early April. With good views of individual birds a knowledgeable and experienced observer may reliably identify Savannah Sparrows as Belding's or non-Belding's under field conditions. Non-Belding's savannah sparrows were recorded during the current field work. The breeding season for Belding's Savannah Sparrow has been estimated as mid-March to mid-July, though some young may fledge and remain dependent into August. Primary threats to the subspecies are loss and degradation of middle elevation coastal saltmarsh, and disturbance and predation. Belding's savannah sparrow is not recorded within the Project study area or Los Angeles Harbor. The last documented sighting occurred in 1984 within Long Beach harbor where an individual was observed (LAHD 2002 - ). The small amount of pickleweed present within the Cabrillo marsh is not sufficient to support this subspecies. It is expected that if this species were to occur within the Project study area it would be extremely rare and brief. |
| Tricolored Blackbird (*Agelaius tricolor*) | SSC | None | This species colonially nests in freshwater marshes with dense stands of cattails and/or bulrushes, and occasionally in other riparian-associated thick brush (Small 1994 - Small, A. 1994. California Birds: Their Status and Distribution. Ibis Publishing Company, Vista, CA. 342 pp.); foraging during nesting occurs in open lands with sparse vegetation in vicinity to the nesting colony. At other times of the year this species can be found in flocks foraging in open, expansive sparsely vegetated lands. Within the Project study area it is conceivable that the species could occur but it is highly unlikely given the surrounding urban setting and the limited open space present within the Project study area. |
| California Western Mastiff Bat (*Eumops perotis californicus*) | SSC | Low | In southern California this subspecies of mastiff bat is found throughout the coastal lowlands up to drier mid-elevation mountains. Habitats include dry woodlands, shrublands, |

| SPECIES / NATURAL COMMUNITIES[1] | SPECIAL STATUS[2] | OCCURRENCE[3] LIKELIHOOD | COMMENTS[4] |
|---|---|---|---|
| | | | grasslands, and occasionally even developed areas. This big bat forages in flight. They are active at night year round and are documented to travel over 15 miles (24 kilometers) in foraging bouts. Roost sites may be in natural rock or in tall buildings, large trees or elsewhere, but must be at least 2 inches (5 centimeters) wide and 12 inches (30 centimeters) deep, and narrow to at most 1 inch (2.5 cm) at their upper end. Nursery roosts must be deeper yet. All roosts open well up on a cliff or other steep face, at least 6.5 feet (2 meters) vertically above the substrate, to allow flight from the roost. Roosts may be communal (up to 100 individuals) or solitary, and commonly include other species of bats. Within the Project study area this species has not been documented, however it is possible that roosting habitat may include crevices or compartments in buildings or warehouses. |
| Big Free-tailed Bat (*Nyctinomops (=Tadarida) macrotis*) | SSC | None | This species of bat is nearly restricted to Mexico, with small numbers of incursions recorded into the developed portions of western San Diego County and a few additional records elsewhere in the state. The species roost in high rock crevices and cliffs, and forage primarily on large moths, especially over water. Habitats are arid, with particular preference for rough, rocky country. An individual of this species was collected in Long Beach in 1983. The species is a rarity at best and is not expected to occur within the Project study area. |
| Pacific Pocket Mouse (*Perognathus longimembris pacificus*) | FE, SSC | None | This subspecies is an obligate resident of fine-grained sandy soils of coastal strand, coastal dunes, river and marine alluvium, and coastal sage scrub in close proximity to the ocean, and has never been collected more than 2 miles (about 3 kilometers) from the coast or above 600 feet (about 180 meters) elevation. No potential habitat for this species is present within the Project study area. |
| San Diego Desert Woodrat (*Neotoma lepida intermedia*) | SSC, MSHCP | None | This is a medium-sized native rat locally common in a variety of sunny shrub habitats, frequently in rocky and/or steep terrain and upper drainages. Sage scrub communities are frequently occupied, but with other communities also used as suitable microhabitats are available. Potentially suitable habitat for the species is absent from the Project study area. |
| **NATURAL COMMUNITIES** | | | |
| Coastal and Valley Freshwater Marsh | CNDDB | Confirmed | A 0.3-acre freshwater marsh is located within the Project study area at the 22nd Street/Old Tank Farm Land open space. This marsh is highly degraded and isolated. Refer to Section 3.3.2.1 |

| SPECIES / NATURAL COMMUNITIES[1] | SPECIAL STATUS[2] | OCCURRENCE[3] LIKELIHOOD | COMMENTS[4] |
|---|---|---|---|
| | | | for further details and the jurisdictional delineation performed. |
| Southern Coastal Salt Marsh | CNDDB | Confirmed | A 3.25-acre coastal salt marsh is present at Cabrillo. It was created in 1982 and is vegetated by nonnative and native vegetation in the uplands and native pickleweeds (*Salicornia virginica*, *S. subterminalis*) and saltgrass (*Distichlis spicata*) along the periphery of the intertidal mudflats. The shallow waters provide spawning and nursery areas for fish and a variety of watersbirds are expected to regularly roost and/or forage w/in the marsh throughout the year. |

# HISTORIC RESOURCES EVALUATION
# Port of Los Angeles Municipal Pier No. 1

## 1. Introduction

The Los Angeles Harbor Department (LAHD) has contracted with ESA to perform a historic resources survey and evaluation of Municipal Pier No. 1 (see Figure 1, Location Map). The Port of Los Angeles (POLA) is planning to implement the City Dock project, which would make a number of alterations and improvements to the sheds at Berths 57-60, as well as to Municipal Pier No 1 which supports these sheds.

Previous studies[1] of the site suggested that, in addition to the sheds at Berths 57-60, Municipal Pier No. 1 supports these structures, may also be eligible for listing in the National Register of Historic Places (NRHP) either individually, or as a potential historic district. The LAHD requested that ESA provide a conclusive evaluation of the eligibility of Municipal Pier No. 1 for the LAHD City Dock project.

This report documents ESA's methods and findings of an intensive architectural survey and evaluation of Municipal Pier No. 1. Efforts included performing a review of previous studies; conducting additional archival research; surveying Municipal Pier No. 1; and applying the eligibility criteria for listing in the NRHP, CRHR, and City of Los Angeles Landmark criteria. All survey and evaluation work was conducted by ESA's senior preservation specialist, Brad Brewster, who meets the Secretary of Interior's professional qualification standards for both architectural history and preservation planning. Mr. Brewster supervised additional research conducted by Candace Ehringer, Registered Professional Archaeologist. Mr. Brewster and Ms. Ehringer have more than 25 years of combined experience working on cultural resources studies.

## 1.1 Methods

### Previous Study Findings

ESA reviewed previous inventories and evaluations of the Signal Street properties at the Port of Los Angeles, including those by San Buenaventura Research Associates in the late 1990s, and ICF Jones & Stokes in 2000 and 2008.

[1] ICF Jones & Stokes, *Final Architectural Survey and Evaluation of Signal Street Properties Port of Los Angeles, Los Angeles, California*, 2008.

Historic Resources Evaluation Report for Port of Los Angeles - Municipal Pier No. 1 . 201278.14

**Figure 1**
Location Map

In the late 1990s, San Buenaventura Research Associates under subcontract for Fugro West, Inc. prepared for the POLA Environmental Management Division Phase I and Phase II of a Cultural Resources Reconnaissance Survey of 7,500 Acres of land and water for the Port of Los Angeles. The purpose of the phased reconnaissance survey was to identify "potentially" eligible historic resources located on the POLA property and make recommendations of eligibility for the NRHP and for designation as City of Los Angeles Historic Cultural Monuments for individual buildings, and "potential" historic districts at the Port. As part of the Phase II report, San Buenaventura Research Associates proposed a historic district encompassing the entire Pier One area south of 22nd Street. As recommended, the potential historic district includes but may not be limited to transit shed structures at Berths 57-60, Municipal Warehouse No. 1, the U.S. Immigration Station, the former Pan American Petroleum Company site (Berth 70, Westway building), and the Municipal Fish Market. Recommended potential districts, such as "Pier One," were not formally defined and documented in the report (Fugro West, Inc. 1997).

In 1999, the large, concrete, 6-story Warehouse No. 1, completed in 1917 and located at the southern end of Municipal Pier No. 1, was surveyed and evaluated by Jones & Stokes. This massive structure was identified as a property eligible for listing in the National Register of Historic Places (Jones & Stokes, 1999). Warehouse No. 1 was subsequently nominated to, and listed in, the Register in the following year.

In 2008, ICF Jones & Stokes surveyed and evaluated six properties located on or near Signal Street, which are either located on, or immediately adjacent to, Municipal Pier No. 1. These are the Transit Shed Berths 58-60, Immigration Station (Canetti's Restaurant, 309 E. 22nd Street), Transit Shed Berth 57, Pan American Petroleum Company Marine Loading Station Facility – Berth 70 (Westway Terminal Building), 264 and 270 E 22nd Street, and Pan-Am Terminal Facility – Berth 56 (California Fish and Game Building). ICF Jones & Stokes found that all six properties appear to be eligible for listing in the NRHP and the CRHR, as well as appear eligible for listing as Los Angeles Historic –Cultural Monuments (ICF Jones & Stokes, 2008).

Although Municipal Pier No. 1 itself was not surveyed and evaluated at an intensive level by Jones & Stokes in 2008, they inferred that the Pier has potential historical significance because it was an integral part of the Port during the early half of the 20th Century, and the basic layout and facilities at the Pier have changed little since the late 1920s. They also inferred that Municipal Pier No.1 was eligible as part of a potential historic district, with multiple other contributing structures, upon future intensive-level survey and evaluation.

## 1.2 Archival Research

Archival research for the current evaluation of Municipal Pier No. 1 was conducted at POLA, the Los Angeles Public Library, various online sources, and the South Central Coastal Information Center (SCCIC) at the California State University at Fullerton.

## 1.3 Fieldwork

On December 10, 2010, Mr. Brewster conducted an intensive field survey of Municipal Pier No. 1. As part of this survey, Mr. Brewster took photographs and prepared descriptions of the Pier and associated structures atop the Pier. These descriptions are provided in Section 5, below, as well as in California Department of Parks and Recreation (DPR) Forms 523A and B, located in Appendix B. With 17 years of experience surveying and evaluating historic resources throughout the West Coast, Mr. Brewster meets the Secretary of the Interior's qualifications for architectural history.

## 1.4 Area of Potential Effects (APE)

The Area of Potential Effects (APE) was delineated as the entire Municipal Pier No. 1 south of 22nd Street. The APE map is shown in Figure 2 below. The APE includes the geographic areas within which the undertaking may directly or indirectly cause alterations in the character or use of historic properties, if any such properties exist, including all ground-disturbing activities, staging areas, and construction zones. As such, the APE includes not only the Pier structure itself, but also the sheds and warehouses which are located atop the structure.

# 2. Regulatory Context and Significance Criteria

## 2.1 Federal Regulations

To establish the significance of a property, the National Register of Historic Places (National Register) criteria for evaluation set forth in 36 CFR Part 60.4 must be applied. The following criteria are designed to guide the states, federal agencies, and the Secretary of the Interior in evaluating potential entries for the National Register. The quality of significance in American history, architecture, archaeology, and culture is present in districts, sites, buildings, structures, and objects that possess at least one of the following:

A. that are associated with events that have made a significant contribution to the broad patterns of our history; or

B. that are associated with the lives of persons significant in our past; or

C. that embody the distinctive characteristics of a type, period, or method of construction or that represent the work of a master or that possess high artistic values or that represent a significant and distinguishable entity whose components may lack individual distinction; or

D. that have yielded, or may be likely to yield, information important in prehistory or history.

The question of integrity is another factor that must be addressed when determining the eligibility of a resource for listing in the National Register. The Secretary of the Interior describes integrity as "the ability of a property to convey its significance." A property must retain certain intact physical features in order to convey its significance under one or more of the NRHP criteria.

APE Boundary

SOURCE: Google Earth, 2011

**Figure 2**
APE Map

Integrity is judged on seven aspects; location, design, setting, workmanship, materials, feeling, and association. If a particular resource meets one of these criteria and retains sufficient integrity to convey its historic significance, it is considered as an eligible "historic property" for listing in the National Register. Additionally, unless exceptionally significant, a property must be at least 50 years old to be eligible for listing.

## Section 106

Section 106 of the National Historic Preservation Act (NHPA) of 1966 requires that a federal agency with direct or indirect jurisdiction over a proposed federal or federally-assisted undertaking, or issuing licenses or permits, must consider the effect of the proposed undertaking on historic properties. An historic site or property may include a prehistoric or historic district, site, building, structure, or object included in, or eligible for inclusion in the National Register maintained by the U.S. Secretary of the Interior. Federal agencies must also allow the Advisory Council on Historic Preservation (ACHP) to comment on the proposed undertaking and its potential effects on historic properties.

The implementing regulations for Section 106 of the NHPA (36 CFR 800) require consultation with the State Historic Preservation Officer (SHPO), the ACHP, federally recognized Indian tribes and other Native Americans, and interested members of the public throughout the compliance process. The four principal steps are:

- initiate the Section 106 process (36 CFR 800.3);
- identify historic properties, resources eligible for inclusion in the NRHP (36 CFR Section 800.4);
- assess the effects of the undertaking on historic properties within the area of potential effect (36 CFR 800.5); and
- resolve adverse effects (36 CFR 800.6).

Adverse effects on historic properties are often resolved through preparation of a memorandum of agreement or programmatic agreement developed in consultation between the federal agency, the SHPO, Indian tribes, and interested members of the public. The ACHP is also invited to participate. The agreement describes stipulations to mitigate adverse effects on historic properties or listing in the National Register of Historic Places (36 CFR §60).

## Significance Criteria under NHPA

A significant impact would occur if a proposed action results in an adverse effect to a property that is listed in or eligible for inclusion in the National Register. The specific Criteria of Effect and Adverse Effect, as defined in 36 CFR 800.9, used to evaluate an undertaking's effect on a historic property, are as follows:

- An undertaking has an effect on a historic property when it may alter the characteristics of the property that qualify the property for inclusion in the National Register. For the purpose

of determining effect, alteration to features of the property's location, setting, or use may be relevant depending on a property's significant characteristics and should be considered.

- An undertaking is considered to have an adverse effect when the effect on a historic property may diminish the integrity of the property's location, design, setting, materials, workmanship, feeling, or association. Adverse effects on historic properties include, but are not limited to:

  (1) Physical destruction, damage, or alteration of all or part of the property;

  (2) Isolation of the property from or alteration of the character of the property's setting when that character contributes to the property's qualification for the National Register;

  (3) Introduction of visual, audible, or atmospheric elements that are out of character with the property or alter its setting;

  (4) Neglect of a property resulting in its deterioration or destruction; and

  (5) Transfer, lease, or sale of the property.

## 2.2 State Regulations

The State implements the NHPA through its statewide comprehensive cultural resources surveys and preservation programs. The California Office of Historic Preservation (OHP), as an office of the California Department of Parks and Recreation, implements the policies of the NHPA on a statewide level. The OHP also maintains the California Historic Resources Inventory. The State Historic Preservation Officer (SHPO) is an appointed official who implements historic preservation programs within the State's jurisdictions.

### California Register of Historical Resources

The CRHR includes resources that are listed in or formally determined eligible for listing in the NRHP and some resources designated as California State Landmarks and Points of Historical Interest (PRC Section 5024.1, 14 California Code of Regulations [CCR] Section 4850). Properties of local significance that have been designated under a local preservation ordinance (local landmarks or landmark districts) or that have been identified in a local historical resources inventory may be eligible for listing in the CRHR and are presumed to be significant resources for purposes of CEQA unless a preponderance of evidence indicates otherwise (State CEQA Guidelines Section 15064.5[a][2]). The eligibility criteria for listing in the CRHR are similar to those for NRHP listing but focus on the importance of the resources to California history and heritage. A cultural resource may be eligible for listing in the CRHR if it (see 14 CCR Section 4852):

(1) is associated with events that have made a significant contribution to the broad patterns of California's history and cultural heritage;

(2) is associated with the lives of persons important in our past;

(3) embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of an important creative individual, or possesses high artistic values; or

(4) has yielded, or may be likely to yield, information important in prehistory or history.

In addition to meeting one of the four criteria listed above, a resource eligible for listing in the California Register must retain historic integrity, and is typically fifty years old or older, except where it can be demonstrated that sufficient time has passed to understand the historical importance of the resource.

### Significance Criteria under CEQA

The California Environmental Quality Act (CEQA) specifically addresses the protection of historic resources. Based on the Appendix G of the CEQA Guidelines, a project would have a significant impact on historic resources if it would, "result in a substantial adverse change in the significance of a historical resource that is either listed or eligible for listing on the National Register of Historic Places, the California Register of Historic Resources or a local register of historic resources."

## 2.3 Local Regulations

The Los Angeles Municipal and Administrative Codes address the preservation of historic and cultural monuments, and Preservation Zones. A list of historical and cultural monuments has been compiled and is maintained by the Cultural Heritage Commission, a board of five persons appointed by the Mayor and approved by the City Council. It is the responsibility of the Cultural Heritage Commission to oversee and approve the establishment of Preservation zones (LA Municipal Code Sec. 12.20.3) and to preserve monuments when such action is not in conflict with the public health, safety, and general welfare (LA Administrative Code Sec. 22.128).

According to Section 22.130 of the Los Angeles Municipal Code, a historical or cultural monument is "any site (including significant trees or other plant life located thereon), building or structure of particular historic or cultural significance to the City of Los Angeles, such as historic structures or sites in which the broad cultural, economic or social history of the nation, State or community is reflected or exemplified, or which are identified with historic personages or with important events in the main currents of national, State or local history or which embody the distinguishing characteristics of an architectural type specimen, inherently valuable for a study of a period, style or method of construction, or a notable work of a master builder, designer, or architect whose individual genius influenced his age."

According to Section 22.171 of the Los Angeles Municipal Code, 'The [Historic Preservation] Commission shall take all steps necessary to preserve Monuments not in conflict with the public health, safety and general welfare, powers and duties of the City of Los Angeles, or its several boards, officers or departments. These steps may include assistance in the creation of civic citizens' committees; assistance in the establishment of a private fund for the acquisition or restoration of designated Monuments; and recommendation that a Monument be acquired by a governmental agency where private acquisition is not feasible."

# 3. Historical Setting – Port of Los Angeles

The following historical setting has been adapted, in part, from the intensive-level surveys of the Port of Los Angeles prepared by Jones & Stokes in 2008, as well the reconnaissance-level surveys by San Buenaventura Research Associates from 1992 to 1996. Additional historical information developed by ESA has been inserted into the historic setting where appropriate.

## 3.1 Early History

The Port of Los Angeles is located approximately 20 miles from downtown Los Angeles, at the southernmost point in Los Angeles County. Due to its location on the Pacific Ocean, the surrounding area historically served as a port facility to varying degrees. Commonly referred to as San Pedro, the port is located within the boundaries of three historic ranchos: Rancho San Pedro, Rancho Los Palos Verdes, and Rancho Los Cerrios. These ranchos, conferred by Governor Pedro Fages to three veterans of the 1769 Portola expedition, possessed combined acreage equaling almost 84,000 acres (Beck and Haase 1974). Owners of the rancho lands earned a living through the raising of cattle and participation in the hide and tallow trade, and by 1830, San Pedro was considered a leading hide center on the west coast (Rawls and Bean 1993; Queenan 1986).

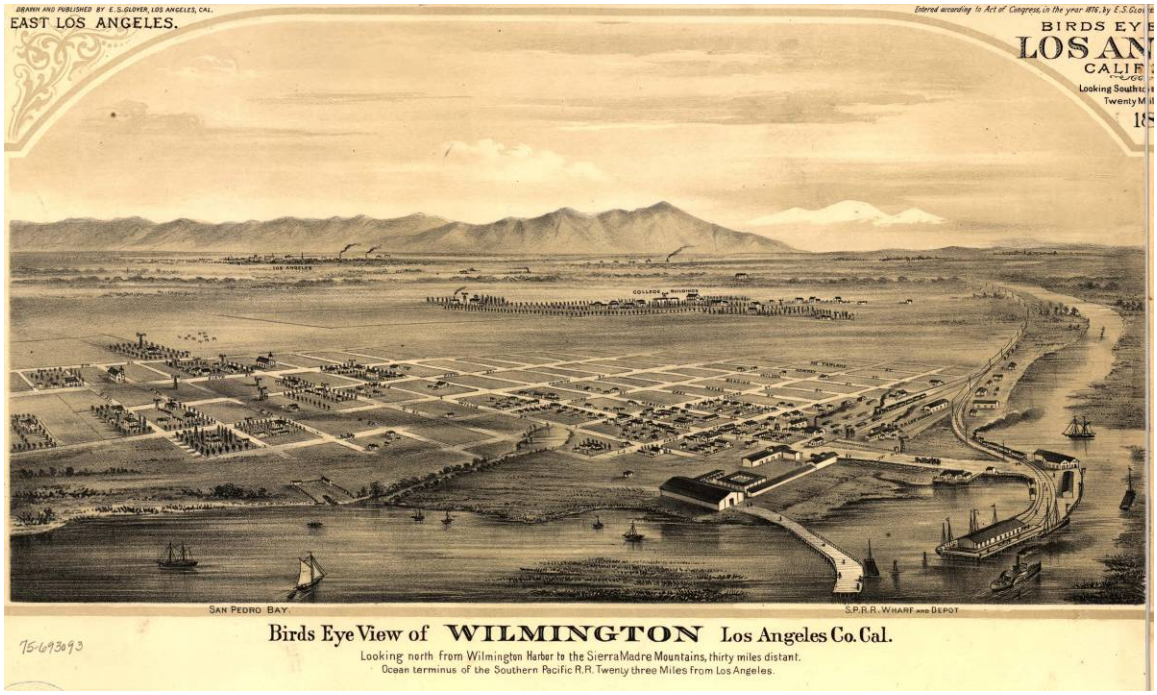
Following the annexation of California by the United States and the subsequent Gold Rush, an influx of new settlers descended upon the San Pedro area. While some residents realized the area's potential as a port area, the region was underused as a port during this period. Cattle and sheep ranching continued to dominate the economy, with one of the largest sheep operations in California, Flint, Bixby & Company, establishing the largest portion of its operation in San Pedro (Queenan 1986; Beck and Hasse 1974).

## 3.2 Commercial Shipping, 1857–1897

One of the earliest residents of the area, Phineas Banning, realized the potential of the area as a commercial shipping port, and in 1857, he constructed new docks to take advantage of the increasing trade coming in and out of Los Angeles. Two primary routes to the southwest gold fields, the Gila River Trail and the Old Spanish Trail, ended in Los Angeles. Banning shuttled materials on smaller boats from his base in Wilmington to and from a second location on the Rancho San Pedro waterfront.

Banning also realized the importance of rail transportation between his operation on the bay and the growing city of Los Angeles. In 1869, Banning and his investors organized the Los Angeles & San Pedro Railroad (LA&SP), marking the beginning of a period of fierce rail competition in the San Pedro and Los Angeles area. Banning's LA&SP was the first route to establish a reliable means of moving cargo from the ships coming into San Pedro Harbor to the City of Los Angeles.

Although the LA&SP was the first short line in southern California, by 1872 it had been purchased by the Southern Pacific Railroad (SPRR). In an attempt to break the stranglehold that the SPRR had on shipping in the area, Senator John P. Jones from Nevada established the Los Angeles and



SOURCE: POLA

**Figure 3**
Library of Congress Map of Wilmington,
Los Angeles County, CA, 1877

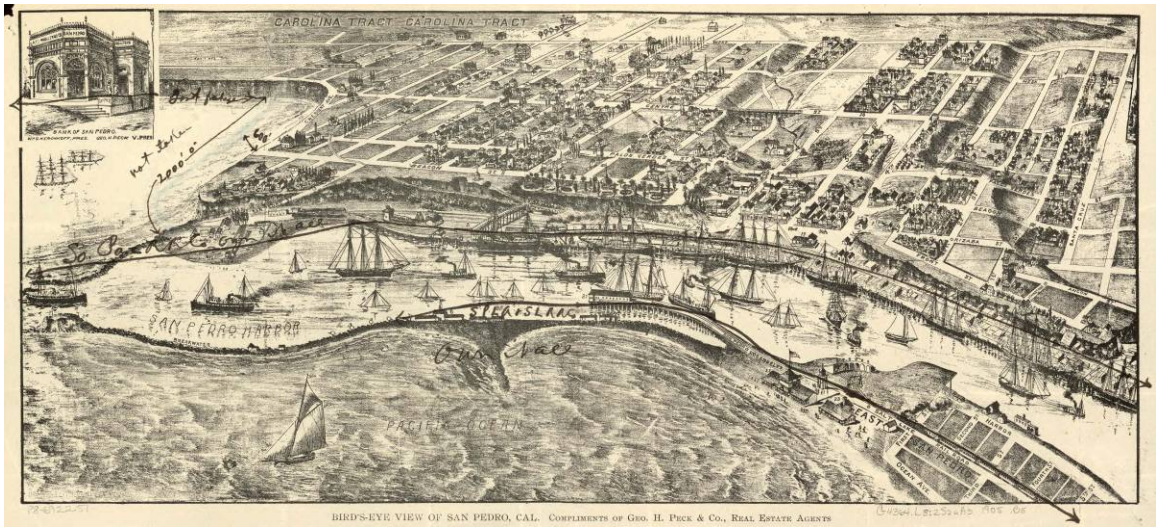
Independence Railroad (LA&I) a year before the SPRR's acquisition of the LA&SP. However, like the LA&SP, the LA&I soon was part of the SPRR system (Queenan, 1986).

Due in part to the improved transportation to and from the harbor, Los Angeles experienced rapid growth during the late nineteenth century. From a population in 1880 of 11,000, the city grew to 50,000 by 1890 and to 102,000 by the turn of the century (Matson, 1920). The increased population brought with it the need for more construction and living supplies, much of which came from ships destined for San Pedro shores.

## 3.3 San Pedro Bay and the Founding of Port of Los Angeles, 1897–1913

Growing commerce in Los Angeles eventually required the formal establishment of a shipping port. The federal government agreed to assist the City of Los Angeles by establishing its official harbor in San Pedro after several studies recommended it over other sites, including a Santa Monica site pursued by Collis Huntington, an influential member of the "Big Four" railroad barons. Following an extensive battle with Huntington, the San Pedro Harbor site won authorization from Congress in March 1897.

In 1906, in preparation for the opening of the Panama Canal, the City of Los Angeles extended its boundaries to coastal tidewaters when it annexed San Pedro. The Port of Los Angeles and the Los Angeles Harbor Commission were officially created in December 1907, and numerous



SOURCE: POLA

**Figure 4**
Library of Congress Map of San Pedro, CA, circa 1905

harbor improvements followed, including the completion of the 2.11-mile breakwater, the broadening and dredging of the main channel, the completion of the first major wharf by the SPRR, construction of the Angel's Gate lighthouse, and the construction of the first municipal pier and wholesale fish market. The construction of the breakwater was a "monumental engineering feat" requiring crane operators to place large boulders in precise locations 40 to 50 feet below the surface of the water. Both Wilmington and San Pedro were part of the City of Los Angeles by 1909, and because of this citywide growth, the Port of Los Angeles became the world's largest lumber importer by 1913 (Marquez and de Turenne, 2007; Matson 1920).

A 9-mile outer breakwater was completed in 1913, splitting the harbor into Inner and Outer Harbors. The Inner Harbor was known as Wilmington Harbor and the Outer Harbor was known as San Pedro Bay. The same year, dredging and filling of Mormon Island (Inner Harbor) allowed for its conversion from swamp land to land suitable for wharves and sheds (Marquez and de Turenne, 2007.) The first industries to use these new facilities were boatbuilding companies.

The opening of the Panama Canal in August 1914 decreased the amount of time spent by ships traveling between eastern and western U.S. ports, and promised to open up new trade opportunities worldwide. In preparation for this new trade, the City of Los Angeles completed one of many large municipal terminals in the harbor. However, the outbreak of World War I that same year temporarily stalled the movement toward expanded worldwide trade (Queenan, 1986).

## 3.4 Wartime Changes, 1914 – 1950

The principal use of the port changed again when England declared war on Germany. At the onset of World War I, the U.S. Navy took possession of a portion of the harbor for a training and submarine base in order to establish a significant presence on the Pacific coast. During the war, the Port was one of the chief sources of employment for residents of the area, with shipbuilding

enterprises turning out vessels by the dozens for the war effort. The Port of Long Beach, established only two years before the onset of the war, offered the only southern California competition to the Port of Los Angeles in terms of shipping or shipbuilding.

Despite the previous use of the Port for the shipment of goods, it was not until 1915 that the Port of Los Angeles began constructing its first warehouse. Warehouse No. 1, located on 60 acres, was six stories in height, with a total storage capacity of 500,000 square feet. Warehouse No. 1 opened on March 6, 1917 to great fanfare, with over 10,000 people in attendance. The completion of this building symbolized the Port's transition to a significant seaport able to handle deep sea ships of varied cargo (Marquez and de Turenne, 2007; Queenan, 1986).

In 1917, Terminal Island was dredged and filled. Boatbuilding companies moved their facilities from Mormon Island to Terminal Island. Oil terminals and petroleum facilities took their place on Mormon Island (Marquez and de Turenne, 2007).

Between 1917 and 1930, distributors constructed a large number of new wharves, warehouses and sheds, indicating a significant increase in trade at the Port. In the 1920s, over 25 million tons of cargo passed through the port (Marquez and de Turenne, 2007).

Transportation systems improvements also encouraged the growth of the import and export trade in the harbor area. By 1917, a vast railroad network existed around the harbor and Los Angeles, which facilitated the efficient movement of goods throughout the country. Los Angeles had an advantage over the Port of San Francisco in that it did not have the Sierra Nevada posing an impediment to cargo shipments en route to the east coast (San Buenaventura Research Associates, 1992).

During the period following the end of World War I in 1918, the Port was increasingly used for importing lumber and other types of raw materials. Similar to the prewar period, the vast majority of inbound cargo to the Port consisted of lumber to satisfy the rapid growth of the Los Angeles area. Exceptional levels of new construction of houses and factories necessitated the importation of lumber on a large scale (Matson, 1920). Comparatively, the biggest export product passing through the Port during the postwar years was crude oil.

Following the end of the war, many trade restrictions were lifted, and the Port provided for the transportation of a wide variety of products. Although lumber and crude oil were the biggest commodities to pass through the Port at the time, Los Angeles featured almost all types of industry. Soon after the war's end, many different types of commerce and business activities developed in the area. Although existing harbor facilities continued to be used for products such as oil, lumber, ships, and fish, new facilities were developed to handle products such as cotton, borax, citrus crops, and steel. In 1923, the City of Los Angeles passed a harbor improvement bond measure, resulting in the construction of additional wharves to meet the demands of increased imports and exports. In order to streamline the railroad portion of shipping in the harbor, the various railroad companies serving the Port consolidated operations by 1929 under the title the Harbor Belt Line Railroad (Queenan, 1986; San Buenaventura Research Associates, 1992).

Harbor traffic slowed during the Depression years and the harbor witnessed a sharp decline in international trade. The Harbor Commission continued to make improvements, however, including a new breakwater extension, completed by 1937, and the construction of new cargo and passenger terminals. The federal government's Works Progress Administration (WPA) helped the Port finance improvements, including passenger and freight terminals and wharf (Queenan, 1986).

As one of the major American ports closest to the fighting in the Pacific Ocean, San Pedro experienced new life and distinction during World War II. Ship and aircraft production facilities in the harbor area worked day and night between 1941 and 1945 to manufacture more than 15 million tons of war equipment. In addition, hundreds of thousands of personnel passed through the Port when departing for and returning from combat.

The LAHD launched a broad restoration program following the war, as many facilities in the harbor required maintenance which had been delayed during the war years. During this time, the LAHD improved several of its buildings and removed many temporary wartime buildings (Queenan, 1986).

## 3.5 Containerization: 1950 to Present

With the rise of containerization following the end of World War II, methods of shipping changed dramatically. Prior to this new method, cargo loading was labor intensive, with individual pieces of cargo, drums, boxes, bags or crates, loaded into ships. Cargo was brought to the dock by truck or train and the individual pieces of cargo were unloaded into transit sheds, sorted and organized, and then moved to the wharf for loading as individual packages into the ship's cargo holds by either ship-based or shore-based cranes where it was then stowed. Alternatively, longshoremen would place the individual pieces of cargo in cargo nets that were hoisted into the ship where the individual pieces of cargo were unloaded and stowed. Some efficiency was achieved by placing several individual containers (e.g., drums, bags, or boxes) on a pallet and then loading the pallet into the cargo hold.

Containerization ships appropriate cargo in standard sized, sealable steel boxes, typically 20 or 40 feet long. Special trailers transport these boxes to and from the port by trucks or rail. An empty container is delivered by truck to a location (manufacture, warehouse, or other enterprise), is loaded with cargo and sealed, then transported by truck or train to the port, where shore-based cranes lift the container from the trailer and place it in the ship's cargo hold or on the ship's deck. After the container is delivered to the destination port, the process was repeated in reverse. This consolidation of cargo in standard-sized containers improves the overall efficiency of transport and allows greater integration of transport by truck, train, and ship.

The adaptation of the maritime industry to containerization involved not only the creation of new ships, truck trailers, rail cars, and cargo cranes designed and built specifically to handle the standard cargo containers, but also the construction of new port facilities. As the loading and unloading of ships and the associated handling was the most time consuming aspect of moving cargo through the Port, under the old loading methods, cargo terminals were designed to

maximize the "surface area" of the terminal by providing as much berthing space as possible, with little backland (transit sheds) to service each wharf.

The containerization method required large-volume terminals, with extensive backlands, and internal roadways to service each wharf. The increased backlands reflected the need for storage of trailers and containers awaiting a ship's arrival, area needed for the loading and unloading of containers onto ships, and area needed to process the containers into and out of the terminal by truck or train. With the increased efficiency, the limiting factor of transferring of cargo became the organization and optimization of storage of containers awaiting shipment, movement to and from the wharf, and cargo flow into and out of the terminal via road or rail. This meant that ports had to either develop new terminals to meet the needs of the new geometry required by containerization or redevelop older terminals. In addition, with containerization, the weight of cargo "packages" (i.e., containers) increased dramatically, requiring much larger cranes and a corresponding move from timber to concrete wharves.

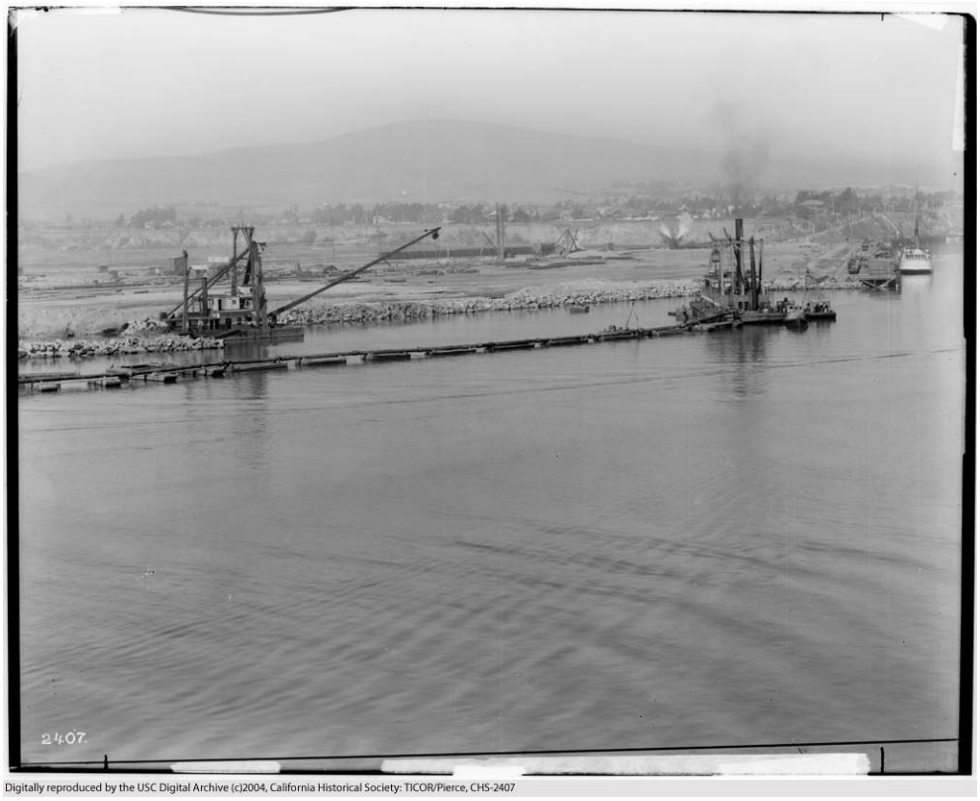
Major improvements to the Port in the 1970s included the deepening of the main channel to accommodate the larger container vessels entering the bay, the purchase of land to expand terminals, and the replacement of older wharves that could not bear the increased weight of newer containers.

Worldwide shipments through the Port increased during the latter half of the 20th century as ocean-going vessels grew to sizes no longer able to negotiate the Panama Canal. Using a "land-bridge" system, shippers wishing to pass materials from the Pacific Ocean to the Atlantic Ocean employed the more efficient practice of unloading at the Port of Los Angeles, moving materials cross country via truck or train, and loading materials onto ships on the east coast.

The following provides a historical context focused on Municipal Pier No. 1.

# 4. Historical Context – Municipal Pier No. 1

In anticipation of increased shipping due to the construction of the Panama Canal, to be completed in 1914, the Los Angeles Board of Harbor Commissioners initiated several improvements at the Port of Los Angeles in the early 1910s to capture a greater portion of the increased shipping traffic in the Pacific. Improvements to the Outer harbor included the construction of the massive Municipal Pier No. 1. Work on the Pier began with the filling of the Huntington Concession (also called the "Huntington Fill") during the spring of 1912. Over 60 acres were in-filled with materials taken from dredging the adjacent channel to a new depth of 35 feet (Marquez and De Turenne, 2007; Board of Harbor Commissioners, 1912-1913; LAT, February 6, 1912). According to the Los Angeles Times, this area provided the best opportunity for deep water wharfage at the Port (LAT, March 26, 1911). The Board of Harbor Commissioners Report for 1912-1913 called the construction of Municipal Pier No. 1 as, "one of the best pieces of wharf construction in the country," and also noted that, "This will be the finest wharf construction that can be built, and is designed for the deep sea commerce of the great ocean lines that will come through the Panama Canal from Europe, or engage in trans-Pacific trade. Figure 5 shows the dredging and fill operations circa 1913.



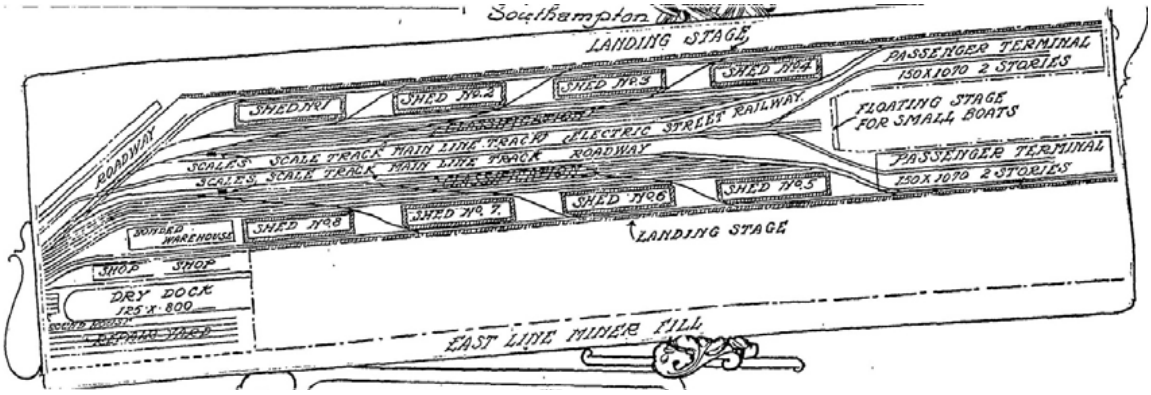
SOURCE: USC Digital Archive

**Figure 5**
Dredgers at Work on the
"Huntington Fill," circa 1913

The successful construction of the adjacent Miner Fill with a reinforced concrete pier (as opposed to a traditional timber pier) provided the model for the construction methods used at Municipal Pier No. 1 (LAT, March 26, 1911). Although he was met with some opposition from City Engineer Homer Hamlin, Harbor Commission board member T.E. Gibbon promoted concrete over timber construction. Gibbon believed that timber construction was obsolete and concrete structures were the wave of the future, especially where oil was involved. Concrete construction helped prevent fires, and given that the Port of Los Angeles was predicted to be one of the largest oil ports in the country, was preferred (LAT, February 6, 1912). This same article compared the Port's project with existing concrete piers in other major ports around the world, including those in Hamburg, Germany, Southampton, England, and Antwerp Belgium; a clear attempt to position the Port of Los Angeles in an international perspective, and exemplifying the enthusiasm for capturing a larger share of the increased world trade resulting from the anticipated opening of the Canal.

The layout of Municipal Pier No. 1 was proposed by Consulting Engineer E.P. Goodrich of New York and prepared by City Engineer Homer Hamlin and Harbor Engineer Vincent (LAT, October 19, 1912). Plans included a 12-foot-high concrete sheet piling retaining wall (bulkhead). The interior was to be filled with dredged materials and raised to a height of 16 feet above the low-

water level. The area was surrounded by 40 feet of docking space placed on concrete pilings.[2] The dock would include modern traveling cranes, 16 railroad tracks, and a roadway wide enough to accommodate an electric railway, as well as provide almost 2 miles of wharfage (LAT, February 6, 1912). The construction contract, in the amount of $444,777 was awarded to Snare & Triest in December 1912 (LAT, December 20, 1912). See Figure 6 showing the original layout of the pier.



SOURCE: Los Angeles Times, February 6, 1912

**Figure 6**
Preliminary Site Plans for Municipal Pier No. 1.

Municipal Pier No. 1, located between the Main Channel and East Channel, was completed in 1914. At that time, the Pier was about 2,520 feet long and 650 feet wide. The pier could be extended an additional 1400 feet into the harbor if increased shipping traffic necessitated additional wharfage (LAT, December 6, 1914). Over 1200 concrete piles and 1100 sheet piles were used in construction. The dock was paved in asphalt by subcontractor Barber Asphalt Company (LAT, May 31, 1914). Dredging of the Main Channel and East Channel to a depth of 35 feet was conducted by the Standard American Company in 1915 (LAT, January 26, 1913; Board of Harbor Commissioners, 1913-1915).

A June 20, 1914 Los Angeles Times article called Municipal Pier No. 1 "the finest reinforced concrete wharf in the world" and praised the work of the Standard American Dredging Company (LAT, June 20, 1914). The article also noted that, "Within a short time the city will have sufficient wharves to accommodate a great volume or traffic, and others will be built as rapidly as they are needed." Figure 7, below, shows a newly completed Municipal Pier No. 1 circa 1914, prior to the construction of sheds or warehouses.

[2] The concrete pile construction was not completed without difficulties, however. According to the 1912-1913 Port of Los Angeles Board of Harbor Commissioners Annual Report, "Difficulty was encountered in the construction of the reinforced concrete wharf along the west side of Municipal Pier No. 1 through the failure of the first piles manufactured for the wharf. In accordance with the specifications prepared by E. P. Goodrich, consulting engineer, of New York, a waterproofing compound was used in making the piles, but at the end of the 30 days when the piles were allowed to cure under the specifications, they cracked and crumbled when lifted. Other piles were then made without the waterproofing, and they have proven satisfactory when cured 30 days. The construction of the wharf is now going forward without delay."

**Figure 7**
Newly Completed Municipal Pier No.1 looking Southwest across the Main Channel, circa 1914 (Miner Fill and associated sheds located in background)

Harbor Commission President Woodman was quoted in a Los Angeles Times article of December 6, 1914, as stating, "The progress in the harbor at the present time is most satisfactory. All the slow and difficult operations, such as dredging, filling, and bulkheading have been attended to, and the dock itself is as complete as could be desired. From now on until the probably distant time when the growth of shipping shall have made additional docks on other city frontage necessary, the development of the Outer Harbor will be simple. Los Angeles is now fully ready to go ahead with wharves, sheds and warehouses as fast as they are needed" (LAT, December 6, 1914).

Los Angeles Municipal Shed No. 1 (Berths 58-60) was constructed on site by 1915 (LAT, May 31, 1914; Board of Harbor Commissioners, 1913-1915). The shed, a one-story steel-frame building, measured 1800 feet long by 100 feet wide. The shed was constructed for, and operated by, the American-Hawaiian Steamship Company (see Figure 8). A portion of the Municipal Pier No. 1 structure can be seen supporting Shed No. 1 in Figure 8.

**Figure 8**
Plans for Municipal Transit Shed No. 1 (Berth 58-60), 1914

Additional transit sheds and other structures were added to the dock over the next several years, including Municipal Warehouse No. 1, a massive, six-story concrete warehouse, which was completed in 1917 (Board of Harbor Commissioners, 1913-1915; Marquez and De Turenne, 2007). See discussion of Municipal Warehouse No. 1, below. The Los Angeles Times article from 1914, anticipating the construction of Warehouse No. 1, claimed that the structure will be the "largest west of Chicago," and noted that together with adjacent Municipal Shed No.1, "the port is expected to meet all shipping requirements for the present" (LAT, December 6, 1914).

Figure 9 shows an aerial view of Municipal Pier No. 1 with completed warehouses and sheds.

### *Municipal Warehouse No. 1*

Municipal Warehouse No. 1 is a large, six-story structure containing 500,000 square feet in its 475 by 150-foot rectangular plan (see Figure 10 on page 20). The building was designed in 1915 by Peter Ficker, then an employee of the Harbor Engineers office.[3] It was constructed with steel reinforced, poured-in place concrete, and has a flat roof with a short parapet wall with an unornamented cornice. The building is characterized by vertical elements on all elevations,

[3] Peter Ficker also designed Municipal Transit Shed No. 1.

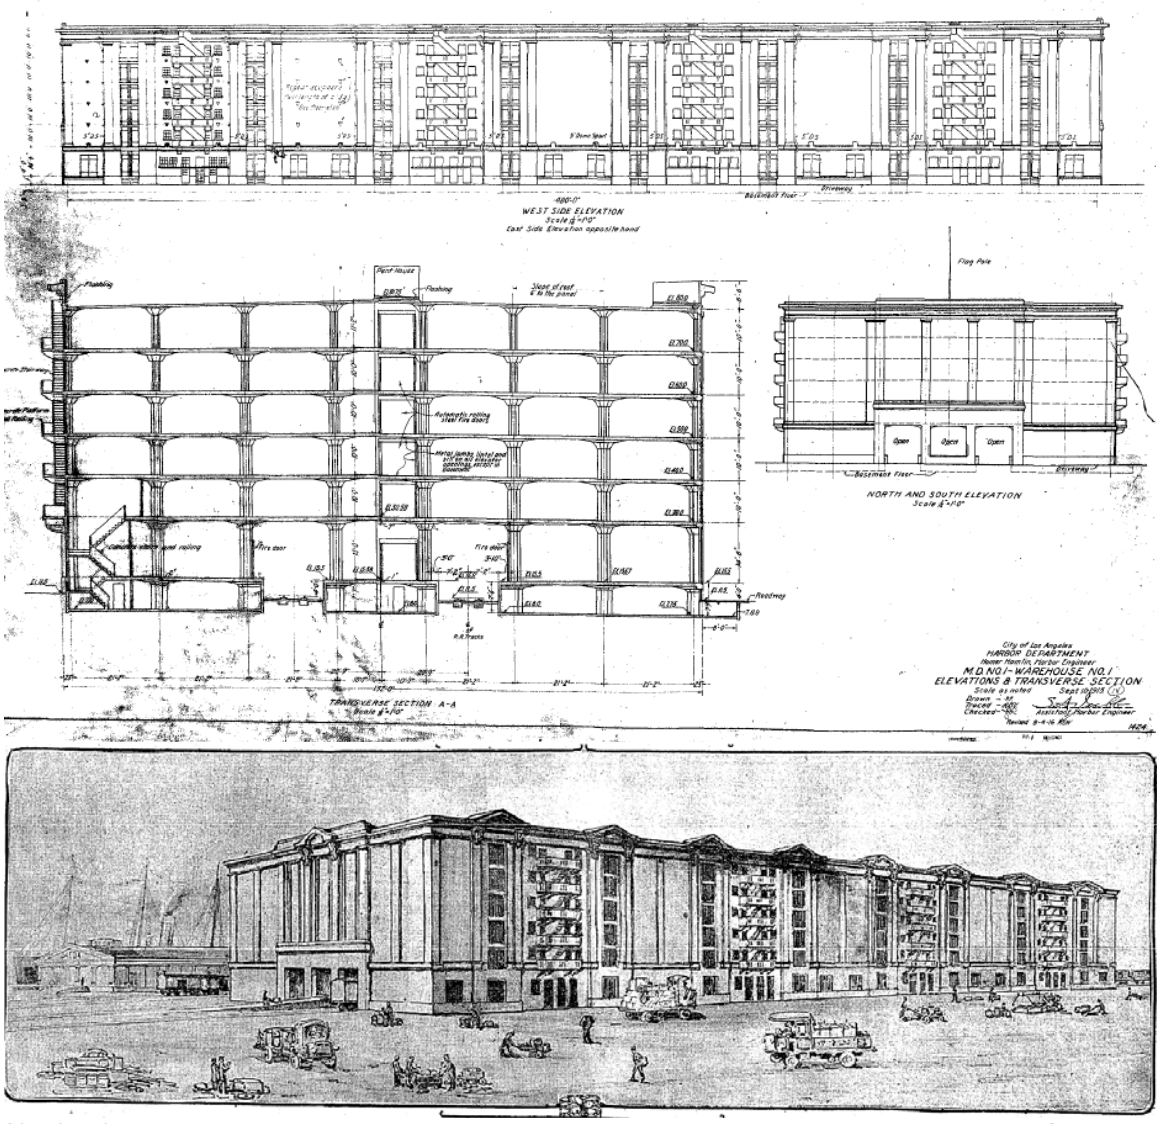
**Figure 9**
Aerial View of Completed Municipal Pier No. 1 showing Warehouse No. 1 (right), Municipal Shed No. 1 (Transit Shed Berths 57-60) (left) and the Pan American Petroleum Co. in the background, October 17, 1925

including full-height engaged pilasters, projecting concrete fire-escape stairways, steel loading bay doors at each floor level, and cast-concrete gargoyle drain spouts at each floor level. The building sits at the southeastern end of Municipal Pier No. 1 adjacent to Berths 59-60, located between Signal Street to the west, the Main Ship Channel on the east and the Outer Harbor to the south. Completed in 1917, Warehouse No.1 served as the Port's only bonded warehouse. International trade required a bonded location for the temporary storage of goods that would go through customs. The bonded portion of a warehouse was also used for particularly valuable goods. During the era of break-bulk cargo handling, warehousing at the port terminals was important for efficient commerce, and Warehouse No.1 served a leading role in warehousing at the Port of Los Angeles from 1917 through the 1950s (Jones & Stokes, 1999).

### *Transit Sheds 57-60*

Transit Shed at Berth 57 was constructed in 1923, immediately north of Municipal Shed No 1. (Sheds at Berths 58-60). The one-story shed, 93 feet wide by 500 feet long, was erected by the James A. Lynch Construction Company under contract with the Port of Los Angeles at a cost of approximately $200,000.



SOURCE: POLA

**Figure 10**
Plans and Drawings for Municipal Warehouse No. 1, 1917

Plans on file with the Port of Los Angeles indicate that a timber wharf extension had been planned along the western edge of the all-concrete pier adjacent to Transit Sheds 57-60 as early as 1924 (Port of Los Angeles, 1924). However, these plans were abandoned in favor of an all-concrete wharf, which was constructed nearly 14 years later in July, 1938. This effort widened the pier by another 30 feet and provided new trackage for railcars loading and unloading goods at Berths 57-60.

The Pan American Petroleum Company Marine Loading Station Facility at Berth 70, including the Westway Terminal Building, was also constructed in 1923.

### *Summary*

Municipal Pier No. 1 became an integral part of the Port during the early half of the 20th Century as several private industries, local and federal government established buildings in the area. Portions of the Pier were also used for US naval functions during World War II. The basic layout and facilities at the Pier have changed little since the late 1920s beyond additions to the tank farms on the east side of the Pier (Los Angeles Board of Harbor Commissioner Annual Report 1924-25). Other minor changes to the Pier itself which occurred within the last 20 years include of newer timber fender piles along the western edge, and a floating dock for a water taxi service constructed on the southern end.

As noted in Jones & Stokes' National Register Nomination form for Municipal Warehouse No. 1. "The process of transshipment dictated the order in which the Harbor Commission funded construction activities: dredging of the ship channel, construction of [Municipal] Pier 1 and associated wharves, transit sheds, and rail lines, and construction of the massive, bonded warehouse. With these facilities in place, the Port of Los Angeles entered into international commerce, and by 1923 had surpassed all the other west coast ports in tonnage and value of cargo" (Jones & Stokes, 1999).

# 5. Description and Evaluation of Municipal Pier No. 1

## 5.1 Description

Municipal Pier No. 1 consists of a continuous, earthen-fill pier, with a concrete perimeter wall (bulkhead) extending south from 22nd Street along Signal Street. The Pier is approximately 2,600 feet long (measured from 22nd Street) and about 600 feet wide, or about 36 acres in size. The Pier is approximately 16 feet above the low-water level. Signal Street runs north-south down the approximate center of the Pier, providing vehicular access to the sheds and warehouses on the Pier. Photos of the structure are provided in Appendix A, and period plans and drawings can be found in Appendix C.

The entire eastern edge of the Pier is comprised of sloped, rip-rap edge oriented at a 45-degree angle to the water. A sloped rip-rap edge can also be found on the majority of the southern end of the Pier, for a length of approximately 530 feet. The remaining 70 feet of the southern end is comprised of concrete pilings and decking. The western edge of the Pier is comprised entirely of concrete pilings, formed in two distinct, parallel, rows. The landward row of concrete pilings is about 40 feet wide and 2,520 feet long, and dates to the Pier's original construction in 1912-1914. Lengthwise, the reinforced concrete piles are spaced about 15 feet apart, and are seven rows deep. Each piling row is spaced approximately 5.5 to 6 feet apart. The pilings, which are roughly octagonal in plan, range in length from 50 to 60 feet in length, and support a board-formed concrete deck of the same width and length (40 feet by 2,520 feet). The landward row of pilings is only visible from the southern edge of the Pier, where the rows of pilings are exposed.

Located immediately west from, and attached to, this first landward row of pilings is a second row of seaward pilings which are about 30 feet wide and 2,520 feet long, and were constructed

during the Pier's westward expansion in 1938. Lengthwise, the reinforced concrete piles are spaced about 15 feet apart, and are five rows deep. Each piling row is spaced approximately 5.5 feet apart. The reinforced concrete pilings are generally square in plan, and range in length from about 62 to 78 feet. Steel-wrapped cross-bracing piles set at an approximate 45 degree angle are visible beneath the deck. These pilings support a reinforced, board-formed, concrete deck of the same width and length (30 feet by 2,520 feet). The fendering system along the western edge consists of newer timber piles attached to the outer (westernmost) row of concrete pilings.

The majority of the decking on Municipal Pier No. 1 is primarily asphalt over earth fill, while smaller portions along the western edge of the Pier are asphalt over concrete decking. Smaller amounts of all-concrete decking are also visible, such as along loading ramps leading to Warehouse No. 1, and between the sheds at Berths 57 and 58. Three rows of railroad tracks are embedded in the Pier and are located between Signal Street and the Sheds at Berths 57-60. Curving side tracks can also be found leading to the northern end of Warehouse No. 1, and to the tank farm located along the Pier's northeastern edge. Two rows of railroad tracks can also be found along the western edge of the Pier where the concrete pile-supported wharf is located adjacent to Sheds 57-60. Wood bullrails are located along the westernmost edge of the Pier, interspersed with iron cleats located at regular intervals. A floating wooden dock and ramp for the water taxi service is located on the southeastern end of the Pier.

The majority of the pier appears to be in original condition, although some spalling and exposure of the reinforcement steel is visible on the pilings at the southernmost end of the structure (and especially within the first row of concrete pilings). Newer concrete and asphalt overlays are visible on the pier decking, some of which obscures the original railroad tracks in various locations.

Numerous structures are located on Municipal Pier No. 1. Six of these structures were previously recommended eligible for listing in the NRHP and CRHR, and are briefly described in the section below. The following is an evaluation of the historical significance of Municipal Pier No. 1. Although the Municipal Fish Market is located on the northeast corner of Municipal Pier No. 1, it has separate historical associations from this structure, and is not described below.

## 5.2 Evaluation

Municipal Pier No. 1 is representative of the Los Angeles Harbor's massive expansion effort in anticipation of the completion of the Panama Canal in 1914, resulting in vastly increased shipping capacity at the Port, and allowing Los Angeles to compete with other world cities for international shipping traffic. As a facility that has been in continuous use since its construction, Municipal Pier No. 1 is an excellent representation of the growth and development of the Port of Los Angeles during the planning and the completion of the Panama Canal. Completion of the massive, earth-fill pier allowed the construction of Warehouse No. 1, Municipal Shed No. 1 (Transit Sheds at Berths 58-60), as well as Transit Shed at Berth 57 to follow in rapid succession as part of a overall plan for port expansion envisioned by harbor commissioners in the 1910s. The local press extolled the initial proposal to construct the Pier in 1912, and as chronicled its completion in 1914, thereby expressing the enthusiasm of the era to capture a larger share of the

increased world trade resulting from the opening of the Canal, and by comparing the Pier with other major piers in ports around the world in an attempt to position the Port of Los Angeles in an international perspective. During the early half of the 20th Century, Municipal Pier No. 1 became an integral part of the Port as several private industries, local and federal government established buildings in the area. Portions of the pier were also used for U.S. naval functions during World War II. The basic layout of the Pier has changed little since the late 1930s. Therefore, Municipal Pier No. 1, inclusive of the entire 36-acre earth-filled pier plus the concrete pile-supported structure along its western edge, appears to meet **NRHP Criterion A** for its association with events that have made a significant contribution to the broad patterns of our history. For similar reasons, Municipal Pier No. 1 appears to meet the criteria for listing in the **CRHR under Criterion 1**, as well as the City of Los Angeles CHC Criterion as a historic structure that exemplifies the broad cultural, political, economic or social history of the nation, state, and community of Los Angeles.

Although not an example of the first use of an earth-fill pier with a reinforced concrete perimeter wall (bulkhead) and a reinforced concrete pile-supported wharf at the Port of Los Angeles, Municipal Pier No 1. was one of the earliest examples to employ this method of construction in favor of timber construction, which had been the standard method at this time. The successful construction of the adjacent Miner Fill with a reinforced concrete pier provided the model for the construction method of Municipal Pier No. 1. Although this construction method initially met with some opposition from City Engineer Hamlin, Harbor Commission Board members prevailed and promoted reinforced concrete and earth-fill over timber construction. Commissioners believed that concrete structures were the wave of the future, and would help prevent fires given that the Port of Los Angeles was predicted to be one of the largest oil ports in the country. In addition, the reinforced concrete wharf pilings and decking constructed along the western edge of the Pier in 1912 are some of the earliest of such structures found at the Port. Timber pile-supported wharves, by comparison, were built throughout the Port well into the 1940s, and were generally phased out by the 1950s as all-concrete pier construction became favored. Therefore, Municipal Pier No. 1 appears to meet **NRHP Criterion C** because it embodies the distinctive characteristics of a method of construction (early use of and earth-fill pier with a reinforced concrete perimeter wall). For similar reasons, Municipal Pier No. 1 appears to meet the criteria for listing in the **CRHR under Criterion 3**, as well as the City of Los Angeles CHC Criterion as a historic structure that is inherently valuable for a study of a period, style, or method of construction.

Municipal Pier No. 1 does not appear to be significantly associated with the lives of persons significant in our past (NRHP/CRHR B/3), or is likely to yield information important in prehistory or history (NRHP/CRHR D/4).

## 5.3 Period of Significance

The historic significance of Municipal Pier No. 1 relates to the role that the Port facilities played in expanding the commercial and economic success of Los Angeles, which anticipated and coincided with the opening of the Panama Canal in 1914, the emergence of Los Angeles as an

"international" city in the early 1920s, and ending with the initiation of containerization in the 1950s. Therefore, the period of significance for Municipal Pier No. 1 is from 1912 (beginning of pier construction) to 1950 (beginning of containerization).

# 6. Previously-Identified Historical Resources on or Near Municipal Pier No. 1

A number of buildings and structures located on or near Municipal Pier No. 1 at the Port of Los Angeles were previously evaluated by ICF Jones & Stokes in 1999 and 2008, and were identified as historical resources under federal, state, and local criteria (see Table 1). One facility, Warehouse No. 1, was ultimately listed in the NRHP. Brief statements of each property's historical significance under federal, state, and local criteria are provided below, excerpted from the 1999 and 2008 Jones & Stokes reports.

**TABLE 1**
**PREVIOUSLY-IDENTIFIED HISTORICAL RESOURCES ON MUNICIPAL PIER NO. 1**

| Name | Date | Historical Status |
|---|---|---|
| Warehouse No. 1 | 1917 | Listed in the NRHP/CRHR |
| Transit Shed Berths 58-60 (Municipal Shed No. 1) | 1914 | Individually eligible for listing in the NRHP/CRHR |
| Transit Shed Berth 57 | 1923 | Individually eligible for listing in the NRHP/CRHR |
| Pan American Petroleum Company Marine Loading Station Facility at Berth 70 (Westway Terminal Building) | 1923 | Individually eligible for listing in the NRHP/CRHR |
| Pan-Am Terminal Facility at Berth 56 (California Fish and Game Building) | 1930, moved c. 1940 | Individually eligible for listing in the NRHP/CRHR |
| Immigration Station (Canetti's Restaurant, 309 E. 22nd Street) | 1921 | Individually eligible for listing in the NRHP/CRHR |

SOURCE: Jones & Stokes, 1999, and ICF Jones & Stokes, 2008.

## Warehouse No. 1

The following is an excerpt of the Statement of Significance from the National Register Nomination form completed for Warehouse No. 1 by Jones & Stokes in 1999.

> Completed in 1917, Warehouse No.1 served as the Port's only bonded warehouse, a function that was critical to the Los Angeles' entry into international trade markets. During the era of break-bulk cargo handling, warehousing at the port terminals played a critical role in achieving economically efficient commerce. Warehouse No.1 served a leading role in warehousing at the Port of Los Angeles from 1917 through the early 1960s when cargo containerization revolutionized cargo handling by nearly eliminating the need for warehousing. Warehouse No.1 continues to serve in its original capacity, and remains a prominent visual landmark for ships entering the deep water channel and for residents and visitors of San Pedro. This building was recommended as eligible for individual listing in

the NRHP by the US Army Corp of Engineers (Roberts, 1978; Schwartz, 1983), and appears to remain eligible under Criterion A (events), for its close association with the rise to international prominence of the modern port. Since no exceptionally important events or trends are related to the period of 1950-1965, the period of significance is that period of break-bulk cargo transshipment between 1917 and 1950 (Jones & Stokes, 1999).

## Transit Shed Berths 58-60

Since their completion in 1914, Transit Shed Berths 58-60 have served as a symbol of the Los Angeles Harbor's expansion period during the build up and completion of the Panama Canal in 1914, which resulted in increased shipping traffic at the port. As a facility that has been in continuous use since its construction, the subject property is an excellent representation of the growth and development of the Port of Los Angeles during the planning and the completion of the Panama Canal. Therefore, Transit Shed Berths 58-60 appears to meet **NRHP Criterion A**. In addition, Transit Shed Berths 58-60 appears significant under **NRHP Criterion C** as an excellent example of neo-classical ornamentation, indicating the importance assigned to architectural design for utilitarian buildings used for Port commerce in the Outer Harbor before the dredging of the Main Channel. For similar reasons, Jones & Stokes found Transit Shed Berths 58-60 to meet the criteria for listing in the **CRHR under Criterion 1** and **Criterion 3**, and appears to meet City of Los Angeles Cultural Heritage Commission (CHC) Criterion as a historic structure that exemplifies the broad cultural, political, economic or social history of the nation, state, and community of Los Angeles (ICF Jones & Stokes, 2008).

## Transit Shed Berth 57

Built in 1923, the Transit Shed at Berth 57 is representative of the general growth of the Port of Los Angeles, specifically the Outer Harbor area during the early 1920s. The shed served as a symbol of the Los Angeles Harbor's dramatic growth during the post World War I period, which was largely stimulated by an increase in worldwide commerce and the 1920s oil boom. Expansion at the Port included the development of several berths and oil shipping facilities such as the Transit Shed at Berth 57. Consequently, when considered as part of the larger Outer Harbor area, Transit Shed at Berth 57 is indicative of a period of tremendous growth and progress at the port in the early 20th century and appears to meet the criteria for listing in the **NRHP under Criterion A** individually, and as a possible contributor to a potential Pier No. 1 historic district. For similar reasons, Jones & Stokes found Transit Shed Berth 57 to meet the criteria for listing in the **CRHR under Criterion 1**, and appears to meet City of Los Angeles Cultural Heritage Commission (CHC) Criterion as a historic structure that exemplifies the broad cultural, political, economic or social history of the nation, state, and community of Los Angeles (ICF Jones & Stokes, 2008).

## Pan American Petroleum Company Marine Loading Station Facility – Berth 70 (Westway Terminal Building)

Constructed in 1923, the Pan American Petroleum Company Marine Loading Station Facility – Berth 70 (Westway Terminal Building) appears to meet **NRHP Criterion A**. The building gains

significance for its contribution to the broad patterns of local history through its association with development of the oil industry in Los Angeles, the early days of oil shipping from the Port of Los Angeles, and as an example of the rise and fall of Pan American Petroleum Company; one the Nation's top oil producers in the 1920s. For similar reasons, Jones & Stokes found the Westway Terminal Building appears to meet the criteria for listing in the **CRHR under Criterion 1**, and appears to meet City of Los Angeles Cultural Heritage Commission (CHC) Criterion as a historic structure that exemplifies the broad cultural, political, economic or social history of the nation, state, and community of Los Angeles (ICF Jones & Stokes, 2008).

## Pan-Am Terminal Facility – Berth 56 (California Fish and Game Building)

Built circa 1930 and moved to its current location in 1940, the Pan Am Terminal Facility at Berth 56 (California Fish and Game Building) appears eligible under **NRHP Criterion A**, for its association with Pan Am and its China Clipper pioneering flight service which expanded passenger travel service at the Port of Los Angeles in the years prior to World War II. As a Pan Am ticket office, the building played a key role in the development of aviation transportation heritage of the Southern California region through it association with Pan-Am revolutionizing long distance and transoceanic seaplane flights from Los Angles to the Far East. The structure marks the site of the first Pan Am China Clipper flights from Los Angeles to the Antipodes Islands and New Zealand. For similar reasons, Jones & Stokes found the California Fish and Game Building appears to meet the criteria for listing in the **CRHR under Criterion 1**, and appears to meet City of Los Angeles Cultural Heritage Commission (CHC) Criterion as a historic structure that exemplifies the broad cultural, political, economic or social history of the nation, state, and community of Los Angeles (ICF Jones & Stokes, 2008).

## Immigration Station (Canetti's Restaurant, 309 E. 22nd Street)

Constructed in 1921, the former United States Immigration Station appears eligible for the **NRHP under Criteria A** for its association with the Federal Government activities at the Port, as the only extant building designed and used for civilian federal purposes, as well as an excellent representation of the continued use of Port facilities in Cannetti's Restaurant which has become an important part of the Port's cultural heritage. The restaurant, a local institution, has served the Port and surrounding community for well over 50 years, thereby becoming an integral piece of the Port's historic fabric. For similar reasons, Jones & Stokes found the Immigration Station appears to meet the criteria for listing in the **CRHR under Criterion 1**, and appears to meet City of Los Angeles Cultural Heritage Commission (CHC) Criterion as a historic structure that exemplifies the broad cultural, political, economic or social history of the nation, state, and community of Los Angeles (ICF Jones & Stokes, 2008).

# 7. Evaluation of Municipal Pier No. 1 and Associated Structures as a Potential Historic District

Municipal Pier No. 1, as well as associated structures Warehouse No. 1, Municipal Shed No. 1 (Sheds at Berths 58-50) and the Shed at Berth 57, were designed by City Engineer Homer Hamlin and built as part of a master plan by the Harbor Commission in the 1910s to capture increasing international ship traffic in the Pacific in anticipation of the opening of the Panama Canal; an historic event in worldwide shipping. The planning and construction of these facilities occurred during a time of great expansion of the Port of Los Angeles, while their immense size and Neo-Classical detailing of utilitarian structures reflected the optimism and enthusiasm of the era when the City of Los Angeles as a whole was striving to become a major player on the world stage. The very existence of Warehouse No. 1 Municipal Shed No. 1 (Shed at Berths 58-50) and the Shed at Berth 57 would not be possible without the massive earth-filled and concrete pier that underpins their structures and allows them to function as originally designed and connects them by rail and road to the City at large. With a common function, design, and history, Municipal Pier No. 1 and its associated structures appear to meet **NRHP Criterion A as a potential historic district** for their association with events that have made significant contribution to the broad patterns of our history. For similar reasons, Municipal Pier No. 1 and its associated structures appear to meet the criteria for listing in the **CRHR under Criterion 1 as a potential historic district**, as well as the City of Los Angeles CHC Criterion as a potential historic district that exemplifies the broad cultural, political, economic or social history of the nation, state, and community of Los Angeles.

Due to the early use of reinforced concrete construction at the Port of Los Angeles, which reflected both the permanence and the importance of the facility, Municipal Pier No. 1, and associated structures also appear to meet **NRHP Criterion C as a potential historic district** because they embody the distinctive characteristics of a method of construction. Additionally, Warehouse No. 1 and Municipal Shed No. 1 (Transit Shed at Berths 58-60) are excellent examples of neo-classical ornamentation, indicating the importance assigned to architectural design for utilitarian buildings used for Port commerce. For similar reasons, Municipal Pier No. 1 and its associated structures appears to meet the criteria for listing in the **CRHR under Criterion 3 as a potential historic district**, as well as the City of Los Angeles CHC Criterion as a historic structure that is inherently valuable for a study of a period, style, or method of construction.

As structures intimately tied to the early 20th Century history of Municipal Pier No. 1 and identified as potential historical resources in prior studies, the Pan American Petroleum Company Marine Loading Station Facility at Berth 70 (Westway Terminal Building), the Pan-Am Terminal Facility at Berth 56 (California Fish and Game Building), and the Immigration Station (Canetti's Restaurant, 309 E. 22nd Street) also contribute to the historical significance of a potential Municipal Pier No. 1 historic district. As such, contributors to a potential Municipal Pier No. 1 historic district would include; 1) the entire Municipal Pier No. 1 south of 22nd Street, 2) Warehouse No. 1, 3) Shed at Berths 58-60, 4) Shed at Berth 57, 5) the Pan American Petroleum Company Marine Loading Station Facility at Berth 70 (Westway Terminal Building), 6) the Pan-Am Terminal Facility at Berth 56 (California Fish and Game Building), and 7) the Immigration Station (Canetti's Restaurant).

Non-contributors to the potential Municipal Pier No. 1 historic district would include the tank farm and loading docks on the northeastern end of the pier. Although some of the tanks date to the 1920s, many have been removed, and many new facilities have been constructed within the past 50 years which have degraded the overall integrity of the facility and reduced its ability to convey direct historic associations with Municipal Pier No. 1.

Table 2, below, and Figure 11 on the following page, identify the potential Municipal Pier No. 1 historic district and contributing resources.

**TABLE 2**
**CONTRIBUTORS AND NON-CONTRIBUTORS TO THE**
**POTENTIAL MUNICIPAL PIER NO. 1 HISTORIC DISTRICT**

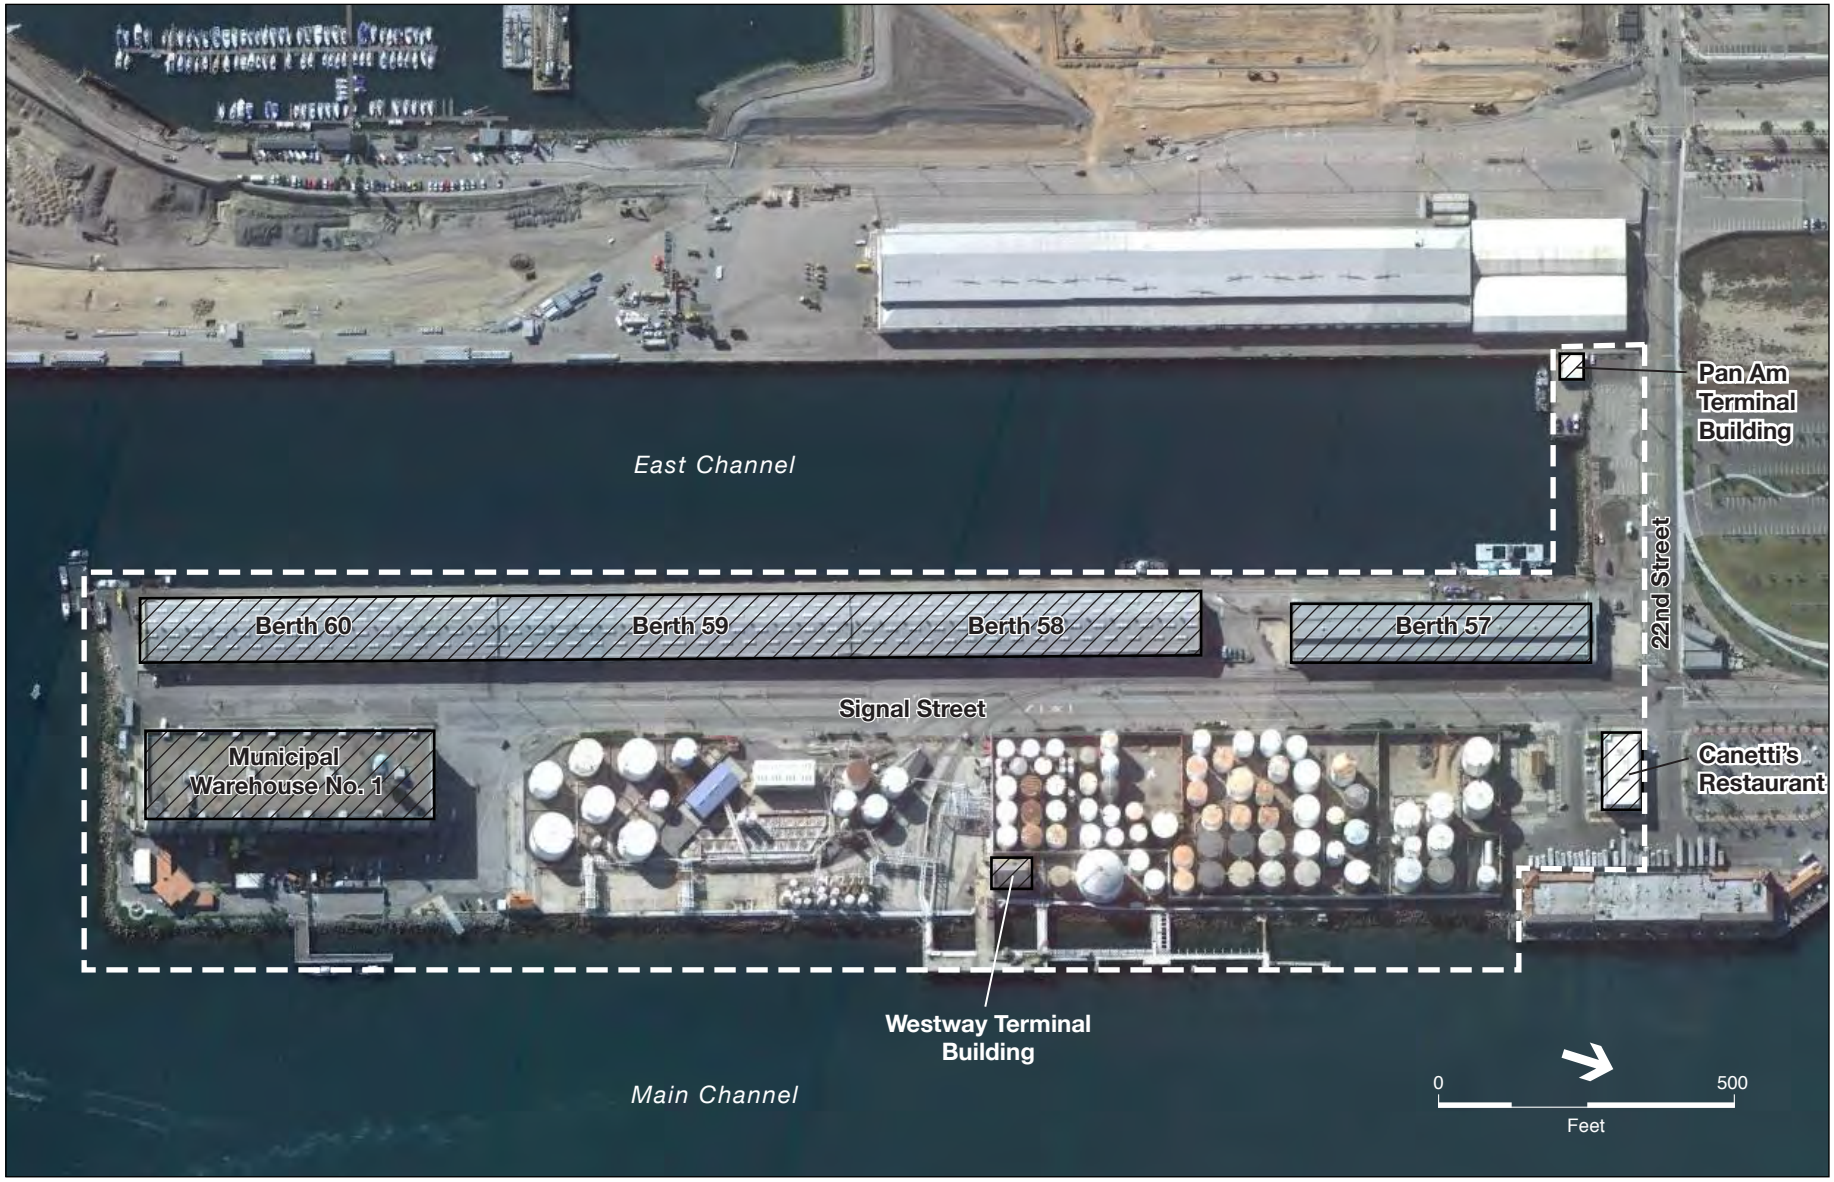
| Potential Contributors | Potential Non-Contributors |
|---|---|
| Municipal Pier No. 1 (from 22nd Street south to the end of Signal Street) | Tank farm and loading docks (northeastern end of the pier) |
| Warehouse No. 1 | Water Taxi docks and trailer buildings |
| Shed at Berths 58-60 | |
| Shed at Berth 57 | |
| Pan American Petroleum Company Marine Loading Station Facility at Berth 70 (Westway Terminal Building) | |
| Pan-Am Terminal Facility at Berth 56 (California Fish and Game Building) | |
| Immigration Station (Canetti's Restaurant at 309 E. 22nd Street) | |

Although the Municipal Fish Market is located on the northeast corner of Municipal Pier No. 1, it has historical associations that are distinct from this structure, and is therefore located outside of the potential historic district.

# 8. Conclusions

Based on an intensive-level survey and evaluation of Municipal Pier No. 1, this facility appears to be individually eligible for listing in the NRHP and CRHR under Criteria A/1 and C/3. The facility also meets the City of Los Angeles CHC Criterion as a historic structure that exemplifies the broad cultural, political, economic or social history of the nation, state, and community of Los Angeles, and as a historic structure that is inherently valuable for a study of a period, style, or method of construction.

Based on this recommendation, as well as the review and incorporation of prior evaluations of the buildings and structures located on or near this facility, Municipal Pier No. 1 is also recommended eligible for listing in the NRHP/CRHR and local register as a potential historic district. Contributors to the potential historic district would include Warehouse No. 1, the Shed at Berths 58-60, the Shed at Berth 57, the Pan American Petroleum Company Marine Loading Station Facility at Berth 70 (Westway Terminal Building), the Pan-Am Terminal Facility at Berth 56 (California Fish and



District Boundary  Contributing Building

SOURCE: Google Earth, 2011

**Figure 11**
Historic District Map

Game Building), and the Immigration Station (Canetti's Restaurant). In summary, these structures appear eligible for listing as contributors to a potential historic district under NRHP/CRHR criteria A/1 for their association with events that have made significant contribution to the broad patterns of our history.

The potential Municipal Pier No. 1 historic district also meets the City of Los Angeles CHC Criterion because it exemplifies the broad cultural, political, economic or social history of the nation, state, and community of Los Angeles. Municipal Pier No. 1 as an entire engineering structure, as well as Municipal Shed No. 1 (Transit Shed at Berths 58-60) additionally appear eligible for listing as contributors to a potential historic district under NRHP/CRHR criteria C/3 because they embody the distinctive characteristics of a type, period, or method of construction (Municipal Pier No. 1 for the early use of reinforced concrete construction, and Municipal Shed No. 1 for the excellent use of neo-classical ornamentation applied to a utilitarian building).

As a result of prior evaluations, the following buildings have been recommended individually eligible for listing in the NRHP, CRHR, and the City of Los Angeles CHC: the Shed at Berths 58-60, the Pan American Petroleum Company Marine Loading Station Facility at Berth 70 (Westway Terminal Building), the Pan-Am Terminal Facility at Berth 56 (California Fish and Game Building), and the Immigration Station (Canetti's Restaurant).

Warehouse No. 1 is currently listed in the NRHP as an individual resource, and is recommended as a contributor to a potential Municipal Pier No. 1 historic district, as described above.

# 9. Recommendations

Specific recommendations regarding the treatment of identified historical resources are typically provided after Port review of the draft conclusions of this report, as well as after receipt of project plans which may identify demolition of, or substantial alterations to, identified historical resources. The Port's proposed City Dock. No. 1 project, which would rehabilitate and reuse the Transit Shed Berths 57-60 for use as a marine research center, and which may require extensive retrofit or replacement of the concrete pile-supported pier which partially supports these sheds, is currently being designed and is not yet fully developed. Regardless, the typical treatment method for the avoidance of significant impacts to historical resources is the application of the *Secretary of the Interior's Standards for the Treatment of Historic Properties with Guidelines for Preserving, Rehabilitating, Restoring and Reconstructing Historic Buildings* (NPS, 1995).

The proposed transit shed rehabilitation project would likely be subject to the Secretary of the Interior's Standards for *Rehabilitation* (other treatments that would likely not apply include preserving, restoring, and reconstructing). The National Park Service defines *Rehabilitation* as, "the act or process of making possible a compatible use for a property through repair, alterations, and additions while preserving those portions or features which convey its historical, cultural, or architectural values."

Some of the most important recommendations contained within the *Standards for Rehabilitation* state that, 1) the historic character of a property shall be retained and preserved, and the removal of historic materials or alteration of features and spaces that characterize a property shall be avoided, and 2) new additions, exterior alterations, or related new construction shall not destroy historic materials that characterize the property. The new work shall be differentiated from the old and shall be compatible with the massing, size, scale, and architectural features to protect the historic integrity of the property and its environment. More specific guidance will be provided in a subsequent report following Port review of the initial conclusions of this report, and after receipt of project plans.

***P3a. Description:** (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)

Municipal Pier No. 1 consists of a continuous, earthen-fill pier, with a concrete perimeter wall (bulkhead) extending south from 22nd Street along Signal Street at the Port of Los Angeles in San Pedro, California. The pier is approximately 2,600 feet long (measured from 22nd Street) and about 600 feet wide. The Pier is approximately 16 feet above the low-water level. Signal Street runs north-south down the approximate center of the pier providing vehicular access to the sheds and warehouses on the pier. Photos of the structure are provided in Appendix A. The entire eastern edge of the pier is comprised of sloped, rip-rap edge oriented at a 45-degree angle to the water. A sloped rip-rap edge can also be found on the majority of the southern end of the pier, for a length of approximately 530 feet. The remaining 70 feet of the southern end is comprised of concrete pilings and decking. The western edge of the pier is comprised entirely of concrete pilings, formed in two distinct, parallel, rows. The first row of concrete pilings is about 40 feet wide and 2,520 feet long, and dates to the pier's original construction in 1912-1914. Lengthwise, the reinforced concrete piles are spaced about 15 feet apart, and are seven rows deep. Each piling row is spaced approximately 5.5 to 6 feet apart. The pilings, which are roughly octagonal in plan, range in length from 50 to 60 feet in length, and support a board-formed concrete deck of the same width and length (40 feet by 2,520 feet). The first row of pilings is only visible from the southern edge of the pier, where the rows of pilings are exposed. (see Continuation Sheet)

**P3a. Description (continued)**

Located immediately west from, and attached to, this first row of pilings is a second row of pilings which are about 30 feet wide and 2,520 feet long, and were constructed during the pier's westward expansion in 1938. Lengthwise, the reinforced concrete piles are spaced about 15 feet apart, and are five rows deep. Each piling row is spaced approximately 5.5 feet apart. The reinforced concrete pilings are generally square in plan, and range in length from about 62 to 78 feet. Steel-wrapped cross-bracing piles set at an approximate 45 degree angle are visible beneath the deck. These pilings support a reinforced, board-formed, concrete deck of the same width and length (30 feet by 2,520 feet). The fendering system along the western edge consists of newer timber piles attached to the outer (westernmost) row of concrete pilings.

The majority of the decking on Municipal Pier No. 1 is primarily asphalt over earth fill, while smaller portions along the western edge of the pier are asphalt over concrete decking. Smaller amounts of all-concrete decking are also visible, such as along loading ramps leading to Warehouse No. 1, and between the sheds at Berths 57 and 58. Three rows of railroad tracks are embedded in the pier located between Signal Street and Sheds at Berths 57-60. Curving side tracks can also be found leading to the northern end of Warehouse No. 1, and to the tank farm located along the pier's northeastern edge. Two rows of railroad tracks can also be found along the western edge of the pier where the concrete pile-supported wharf is located adjacent to Sheds 57-60. Wood bullrails are located along the westernmost edge of the pier, interspersed with iron cleats located at regular intervals. A floating wooden dock and ramp for the water taxi service is located on the southeastern end of the pier. The majority of the pier appears to be in original condition, although some spalling and exposure of the reinforcement steel is visible on the pilings at the southernmost end of the structure (and especially within the first row of concrete pilings). Newer concrete and asphalt overlays are visible on the pier decking, some of which obscures the original railroad tracks in various locations.

**Period of Significance:** 1912-1950 **Property Type:** Wharf **Applicable Criteria:** A and C
(Discuss importance in terms of historical or architectural context as defined by theme, period, and geographic scope. Also address integrity.)

Individual Evaluation.

Municipal Pier No. 1 is representative of the Los Angeles Harbor's massive expansion effort in anticipation of the completion of the Panama Canal in 1914, resulting in vastly increased shipping capacity at the port, and allowing Los Angeles to compete with other world cities for international shipping traffic. As a facility that has been in continuous use since its construction, Municipal Pier No. 1 is an excellent representation of the growth and development of the Port of Los Angeles during the planning and the completion of the Panama Canal. Completion of the massive, earth-fill pier allowed the construction of Warehouse No. 1, Municipal Shed No. 1 (Transit Sheds at Berths 58-60), as well as Transit Shed at Berth 57 to follow in rapid succession as part of a overall plan for port expansion envisioned by harbor commissioners in the 1910s. The local press extolled the initial proposal to construct the pier in 1912, as chronicled its completion in 1914, thereby expressing the enthusiasm of the era to capture a larger share of the increased world trade resulting from the opening of the Canal, and by comparing the pier with other major piers in ports around the world in an attempt to position the Port of Los Angeles in an international perspective. During the early half of the 20th Century, Municipal Pier No. 1 became an integral part of the Port as several private industries, local and federal government established buildings in the area. Portions of the pier were also used for US naval functions during World War II.

**B10. Significance (continued)**

The basic layout of the pier has changed little since the late 1930s. Therefore, Municipal Pier No. 1 appears to meet NRHP Criterion A for its association with events that have made significant contribution to the broad patterns of our history. For similar reasons, Municipal Pier No. 1 appears to meet the criteria for listing in the CRHR under Criterion 1, as well as the City of Los Angeles CHC Criterion as a historic structure that exemplifies the broad cultural, political, economic or social history of the nation, state, and community of Los Angeles.

Although not an example of the first use of a reinforced concrete pier at the Port of Los Angeles, Municipal Pier No 1. was one of the earliest examples to employ this method of construction in favor of timber construction. The successful construction of the adjacent Miner fill with a reinforced concrete pier provided the model for the construction method of Municipal Pier No. 1. Although this construction method initially met with some opposition from City Engineer Hamlin, harbor commission board members prevailed and promoted reinforced concrete over timber construction. Commissioners believed that concrete structures were the wave of the future, and would help prevent fires given that the Port of Los Angeles was predicted to be one of the largest oil ports in the country. In addition, the reinforced concrete wharf pilings and decking constructed along the western edge of the pier in 1912 are some of the earliest of such structures found at the Port. Timber pile-supported wharves, by comparison, were built throughout the Port well into the 1940s, and were generally phased out by the 1950s as all-concrete pier construction became favored. Therefore, Municipal Pier No. 1 appears to meet NRHP Criterion C because it embodies the distinctive characteristics of a method of construction (early use of reinforced concrete pier construction). For similar reasons, Municipal Pier No. 1 appears to meet the criteria for listing in the CRHR under Criterion 3, as well as the City of Los Angeles CHC Criterion as a historic structure that is inherently valuable for a study of a period, style, or method of construction.

Municipal Pier No. 1 does not appear to be significantly associated with the lives of persons significant in our past (NRHP/CRHR B/3), or is likely to yield information important in prehistory or history (NRHP/CRHR D/4).

Period of Significance: The historic significance of Municipal Pier No. 1 relates to the role that the Port facilities played in expanding the commercial and economic success of Los Angeles, which anticipated and coincided with the opening of the Panama Canal in 1914, the emergence of Los Angeles as an “international” city in the early 1920s, and ending with the initiation of containerization in the 1950s. Therefore, the period of significance for Municipal Pier No. 1 is from 1912 (beginning of pier construction) to 1950 (beginning of containerization).

Integrity: With few alterations within the last 45 years, Municipal Pier No. 1 retains integrity of location, design, setting, materials, workmanship, feeling, and association.

District Evaluation:

In addition to being individually eligible for listing in the NRHP and CRHR, Municipal Pier No. 1 was evaluated as a potential contributor to a potential *Port of Los Angeles Municipal Pier No. 1 Historic District.* Six structures located on top of, and supported by, Municipal Pier No. 1 were previously evaluated by Jones & Stokes in 1999 and 2008, and were found to be individually eligible for listing in the NRHP and CRHR. These are; Municipal Shed No. 1 (Transit Shed at Berths 58-60 [1915]), Municipal Warehouse No. 1 (1917), Transit Shed at Berth 57 [1923], Immigration Station (Canetti’s Restaurant, 309 E. 22nd Street [1921]), Pan American Petroleum Company Marine Loading Station Facility at Berth 70 (Westway Terminal Building [1923]), and Pan-Am Terminal Facility at Berth 56 (California Fish and Game Building [1930]). Warehouse No. 1 was listed in the NRHP and CRHR in 2000.

Municipal Pier No. 1, as well as associated structures Warehouse No. 1, Municipal Shed No. 1 (Sheds at Berths 58-50) and the Shed at Berth 57, were designed by the Harbor Engineering Office and built as part of a master plan by Harbor Commission in the 1910s to capture increasing ship traffic in the Pacific in anticipation of the opening of the Panama Canal; an historic event in worldwide shipping. The planning and construction of these facilities occurred during a time of great expansion of the Port of Los Angeles, while their immense size and Neo-Classical detailing of utilitarian structures reflected the optimism and enthusiasm of the era when the City of Los Angeles as a whole was striving to become a major player on the world stage. The very existence of Warehouse No. 1 Municipal Shed No. 1 (Sheds at Berths 58-50) and the Shed at Berth 57 would not be possible without the massive earth-filled and concrete pier that underpins their structures and allows them to function as originally designed and connects them by rail and road to the City at large. With a common function, design, and history, Municipal Pier No. 1 and its associated structures appear to meet NRHP Criterion A as a potential historic district for their association with events that have made significant contribution to the broad patterns of our history. For similar reasons, Municipal Pier No. 1 and its associated structures appear to meet the criteria for listing in the CRHR under Criterion 1 as a potential historic district, as well as the City of Los Angeles CHC Criterion as a potential historic district that exemplifies the broad cultural, political, economic or social history of the nation, state, and community of Los Angeles.

**B10. Significance (continued)**

Due to the early use of reinforced concrete construction at the Port of Los Angeles, which reflected both the permanence and the importance of the facility, Municipal Pier No. 1, and associated structures also appear to meet NRHP Criterion C as a potential historic district because they embody the distinctive characteristics of a method of construction. Additionally, Warehouse No. 1 and Municipal Shed No. 1 (Transit Sheds at Berths 58-60) are excellent examples of neo-classical ornamentation, indicating the importance assigned to architectural design for utilitarian buildings used for Port commerce. For similar reasons, Municipal Pier No. 1 and its associated structures appears to meet the criteria for listing in the CRHR under Criterion 3, as well as the City of Los Angeles CHC Criterion as a historic structure that is inherently valuable for a study of a period, style, or method of construction.

As structures intimately tied to the early 20th Century history of Municipal Pier No. 1 and identified as potential historical resources in prior studies, the Pan American Petroleum Company Marine Loading Station Facility at Berth 70 (Westway Terminal Building), the Pan-Am Terminal Facility at Berth 56 (California Fish and Game Building), and the Immigration Station (Canetti's Restaurant, 309 E. 22nd Street) also contribute to the historical significance of a potential Municipal Pier No. 1 historic district. As such, contributors to a potential Municipal Pier No. 1 historic district would include; 1) the entire Municipal Pier No. 1 south of 22nd Street, 2) Warehouse No. 1, 3) Shed at Berths 58-60, 4) Shed at Berth 57, 5) the Pan American Petroleum Company Marine Loading Station Facility at Berth 70 (Westway Terminal Building), 6) the Pan-Am Terminal Facility at Berth 56 (California Fish and Game Building), and 7) the Immigration Station (Canetti's Restaurant).

Non-contributors to the potential Municipal Pier No. 1 historic district would include the tank farm and loading docks on the northeastern end of the pier. Although some of the tanks date to the 1920s, many have been removed, and many new facilities have been constructed within the past 45 years which have degraded the overall integrity of the facility and reduced its ability to convey direct historic associations with Municipal Pier No. 1.

# SEWER CAPACITY STUDY

FORM GEN 160 (Rev. 6-80)

# CITY OF LOS ANGELES
INTER-DEPARTMENTAL CORRESPONDENCE

SC.MI

DATE: January 26, 2012

TO: Christopher Cannon, Director
Environmental Management
Port of Los Angeles

Adrienne Fedrick, Civil Engineering Associate
Environmental Management
Port of Los Angeles

FROM: Ali Poosti, Division Manager
Wastewater Engineering Services Division
Bureau of Sanitation

SUBJECT: **CITY DOCK NO. 1 MARINE RESEARCH CENTER SEWER CAPACITY STUDY**

The Wastewater Engineering Services Division (WESD) has conducted a sewer capacity analysis for the proposed City Dock No. 1 Marine Research Center Development located at the Port of Los Angeles. Enclosed is a memorandum detailing the results of our analysis.

If you have any questions regarding this report or this request, please contact Kwasi Berko at (323)342-1562 or Fernando Gonzalez at (323) 342-6267.

Thank you for your cooperation.

TECHNICAL MEMORANDUM NO. 2012-001

SUBJECT: City Dock No. 1 Marine Research Center Sewer Capacity Study

PREPARED BY: Rowena Lau, P.E.
Kwasi Berko, P.E.

DATE: January 26, 2012

## INTRODUCTION

### Overview

The purpose of the City Dock No. 1 Marine Research Center Sewer Capacity Study is to determine if there is available capacity within the sewers to accommodate a proposed redevelopment project by the Port of Los Angeles (POLA). The project developer has received comments on March 4, 2011 regarding the impacts on the sewer system determined statically. A dynamic capacity study is required to determine the overall effects on the local collection system upon discharge from the proposed project.

### City Dock No.1 Marine Research Center Project

The City Dock No.1 Marine Research Center Project site is located within the San Pedro Waterfront Plan area, which encompasses approximately 400 acres along the western boundary of the Port, adjacent to the community of San Pedro. The project activity is focused on City Dock No. 1, which encompasses approximately 28 acres and is bounded by the Main Channel on the east, the East Channel on the west, East 22$^{nd}$ Street to the north, and Los Angeles Harbor to the south. The project site as shown in Figure 1 contains Berth 56; Berth 57; Berth 58 through 60; a water taxi service located beyond Berth 60 at the end of City Dock No. 1; and Berths 70 through 71 (the Westway Terminal site).

## Figure 1: Project Site Map

The four (4) areas of proposed development which are designated as Berths 56 and 57, Berths 58–60, Berths 59-60, and Berths 70-71 are served by two existing 8-inch lines on Signal St and Signal St RW. The sewage from both 8-inch lines feed into the Signal Pumping Plant on Signal St. The sewage then continues north into the 22nd & Signal Pumping Plant on Signal St before discharging into a 33-inch sewer line on Beacon St. Ultimately, this sewage flow will be conveyed to the Terminal Island Treatment Plant (TITP).

The anticipated flows of the proposed development are derived from the Bureau of Sanitation Sewer Facility Charges (SFC) Rate Tables. Based on the project description and the SFC Rate Tables, the estimated project flows are as follows:

| Type Description | Average Daily Flow per Type Description (GPD/UNIT) | Proposed No. of Units | Average Daily Flow (GPD) |
|---|---|---|---|
| **BERTHS 56 AND 57** | | | |
| ***Proposed*** | | | |
| SCMI Research Facility | 100 GPD/1000 SQ.FT | 50,100 SQ.FT | 5,010 |
| Faculty Office Space | 150 GPD/1000 SQ.FT | 758 SQ.FT | 114 |
| Teaching Laboratories | 100 GPD/1000 SQ.FT | 3,600 SQ.FT | 360 |
| Research Laboratories | 100 GPD/1000 SQ.FT | 13,849 SQ.FT | 1,385 |
| Lab Support Space | 100 GPD/1000 SQ.FT | 2,300 SQ.FT | 230 |
| Administrative Suite | 150 GPD/1000 SQ.FT | 3,381 SQ.FT | 507 |
| Staff Support Facilities | 250 GPD/1000 SQ.FT | 1,964 SQ.FT | 491 |
| Building Support Facilities | 20 GPD/1000 SQ.FT | 6,870 SQ.FT | 137 |
| Outdoor Teaching/Outreach Classroom | 200 GPD/1000 SQ.FT | 1,997 SQ.FT | 399 |
| Outside Storage Space | 20 GPD/1000 SQ.FT | 6,150 SQ.FT | 123 |
| Hallways, Walkways | 80 GPD/1000 SQ.FT | 5,634 SQ.FT | 451 |

| | | Berths 59-60 Total | **404** |
| **BERTHS 70-71** | | | |
| ***Proposed*** | | | |
| NOAA Admin and Research Facility | 100 GPD/1000 SQ.FT | 50,000 SQ.FT | 5,000 |
| | | Berths 70-71 Total | **5,000** |

| Type Description | Average Daily Flow per Type Description (GPD/UNIT) | Proposed No. of Units | Average Daily Flow (GPD) |
|---|---|---|---|
| **SUMMARY FLOWS FOR PROJECT** | | | |
| | | **Total Proposed Flow** | **254,089** |

## PUMP STATIONS

There are two pump stations located within the vicinity of the project location: Signal Pump Station and the 22nd and Signal Pump Station. The specifications of each pump station are detailed below:

| Pump Station | Capacity (GPM) | Peak Flow (GPM) | Average Flow (GPM) |
|---|---|---|---|
| Signal | 200 | 35 | 3 |
| 22nd and Signal | 100 | 100 | 70 |

According to the specifications of 22nd and Signal Pump Station, during peak flows the maximum capacity of this pump is reached. This situation can be prolonged leading to operational challenges should more discharges come on line in this area in addition to this proposed project.

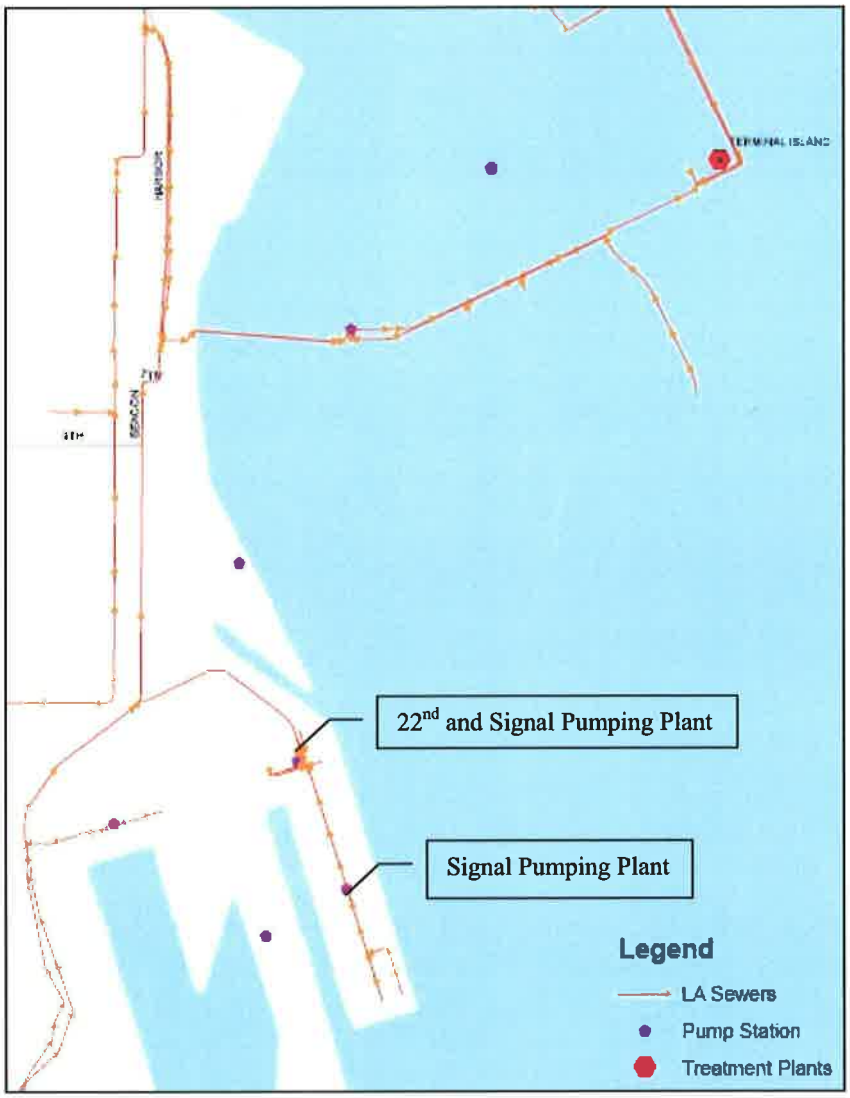
## MODELING APPROACH

MIKE URBAN hydrodynamic modeling was used to analyze following:

1. Verify the current flow conditions in the local sewer system.
2. Determine the hydraulic conveyance adequacy of the collection system using the anticipated project discharges.

A calibrated MIKE URBAN hydrodynamic model of the project area was generated to determine the existing flow conditions and the hydraulic conveyance impact of the project discharge to the existing condition and Year 2050.

## Figure 2: Modeling Area



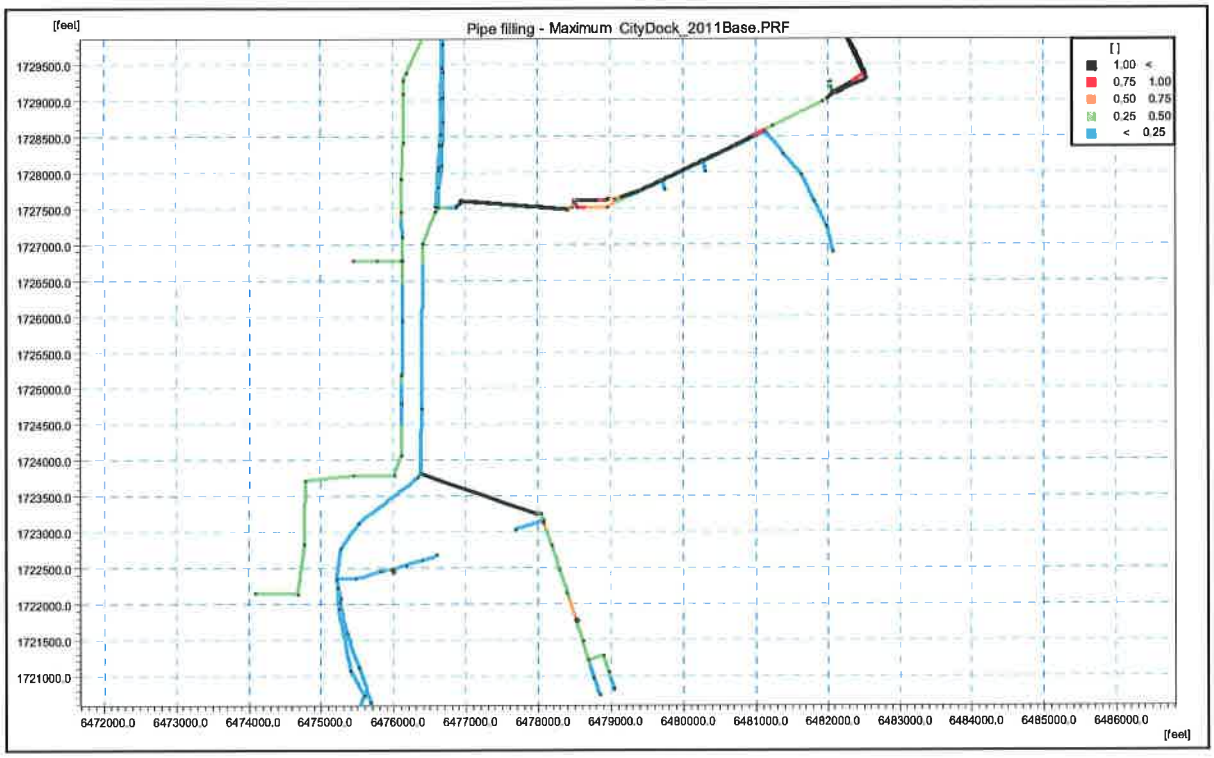
## MODELING SCENARIOS AND RESULTS

2011 Current Configuration

The 2011 Current Configuration model run is used to verify the local sewer response to existing flow conditions. A comparison between MIKE URBAN and recent pump station data shows acceptable agreement.

Figure 3 illustrates the current flow conditions within the collection system. The five (5) black/red areas are either siphons or force mains. Since siphons and force mains flow under pressure, the pipe filling (d/D) shows as full.

## Figure 3: 2011 Flows with Current Configuration

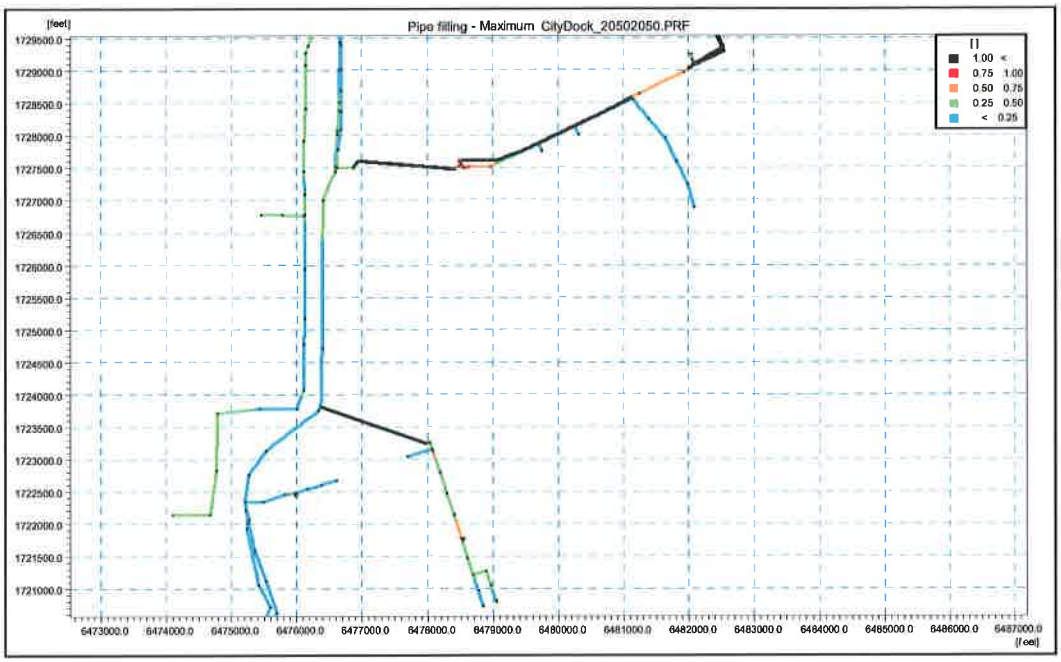


## 2011 Current Configuration with Proposed Project

This model run scenario uses the current (2011) configuration with the anticipated project flows to determine the impact of the project on the local sewer system.

Based on results from this scenario, the proposed project will cause no significant impact to the hydraulic conveyance adequacy of the local sewer system, as shown in Figure 4. The depth of flow is projected to be as high as 72% with peak discharge of 1.34 cubic feet per second (cfs).

## Figure 4: 2011 Flows with Proposed Project

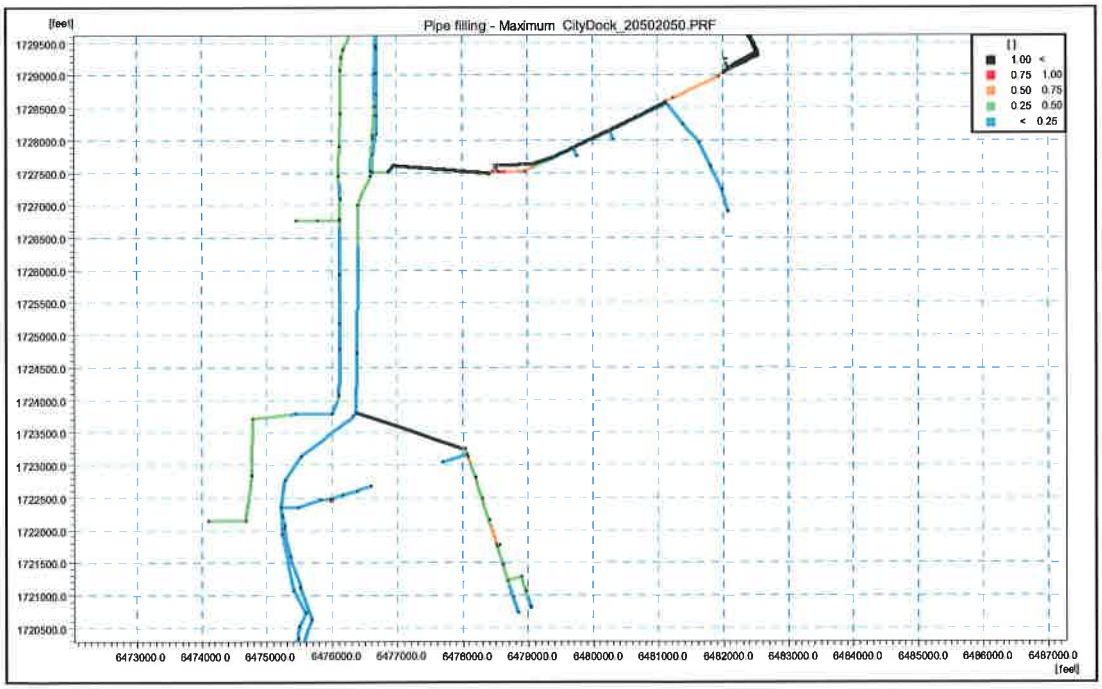


## 2050 Configuration with Proposed Project

This model run scenario uses the future (2050) configuration with the anticipated project flows to determine the impact of the project on the local sewer system.

Based on results from this scenario, the proposed project will cause no significant impact to the hydraulic conveyance adequacy of the local sewer system, as shown in Figure 5. The depth of flow is projected to be as high as 72% with peak discharge of 1.34 cubic feet per second (cfs).

## Figure 4: 2050 Flows with Proposed Project



## CONCLUSION

Based on the MIKE URBAN modeling results, WESD staff determined that the City Dock No.1 Marine Research Center project will not have no major impact on the local collection system provided no significant dischargers connect ahead of the project.

According to the specifications of 22nd and Signal Pump Station, during peak flows the maximum capacity of the pumps is reached. If the project discharge flows prolong the peak hours of the pump station, the developer may be required to upgrade the pump capacity or regulate the discharge rate so as not to strain the operation of the sewer system. A final approval for sewer capacity and connection permit will be made during the permit process phase.
