# I. INTRODUCTION

Fehr & Peers conducted a traffic study to evaluate the potential traffic impacts of the proposed City Dock No. 1 Marine Research Center Project (proposed project) within the Port of Los Angeles (POLA) in Los Angeles, CA. This report identifies the base data and assumptions, explains the methodologies used, and summarizes the findings of the study, which was conducted in support of the environmental impact report (EIR) being prepared for the project. The traffic impact analysis conducted for this report includes analysis of existing (Year 2011) conditions, opening year (Year 2016), full buildout (Year 2024) and cumulative (Year 2042) conditions with the project.

## PROJECT DESCRIPTION

The City Dock No. 1 project site is located within the POLA boundaries at Berths 56-60 and 70-71. Figure 1 shows the project site area. The City Dock No. 1 Project site lies within the San Pedro Waterfront Plan area, which generally encompasses approximately 400 acres along the west side of the Los Angeles Harbor's Main Channel, from the Vincent Thomas Bridge to Cabrillo Beach, adjacent to the City of Los Angeles community of San Pedro. Specifically, the proposed project is located at Berths 56-60 and Berths 70-71. Berth 56 currently hosts a field office and vessel berth for the California Department of Fish and Game. Berths 57 through 60 are currently in use for warehouse operations, and Berths 70 and 71 are part of the Westway Terminal site, formerly used for liquid bulk storage.

The proposed Project would provide a world-class marine research center to support the research needs of the region's universities, research and educational institutions, and government agencies, as well as to provide an incubator for marine-related business ventures. Provided below is a summary of project objectives:

- Provide a location at Berths 56 to 60 and 70 to 71 for marine researchers in Southern California with world-class facilities including laboratories, offices, classrooms, a lecture hall/auditorium and storage space to conduct marine research, including, the study of global climate change and its related phenomena, fisheries, marine resource conservation and management, and other related marine science applications.

- Provide an opportunity for the Southern California Marine Institute (SCMI) and its members, government and other institutional researchers and research organizations to berth research vessels that range in size from small vessels to large 250- to 300-foot vessels at the proposed Project site.

- Provide public amenities, including public education classroom space and interpretive exhibits related to marine studies, along with a continuous waterfront promenade as approved in the San Pedro Waterfront Project.

- Replace existing SCMI facilities now located at Berth 260 in Fish Harbor with a location that allows for an expanded and upgraded SCMI facility in the Los Angeles Harbor to address SCMI's desire for increased research laboratory space with a sea water circulation system, access to deep draft docks to accommodate research vessels, and teaching space.

- Construct the world's largest wave tank using seawater to allow scientists from around the world to study tsunamis, rouge waves, and the generation of wave energy.

**FIGURE 1**

- Provide a location for a marine-related business incubator park for synergy among research and commercial interests, such uses as aquaculture, sustainable energy production, and marine exploration.

The following is a brief summary of project's key elements

- Relocation of SCMI from its existing location at Berth 260 on Terminal Island to Berth 56 and 57.
- Adaptive reuse of the transit sheds at Berths 57-60 to accommodate research, teaching and meeting spaces within a collaborative environment to create research synergies among universities and colleges offering marine science programs. Wharf retrofits of Berths 57-60 and related infrastructure improvements would occur.
- Establishment of a marine science business park/incubator space with offices and research lab space within Berths 59 to 60 Transit Sheds.
- Development of Berths 70 and 71, following the demolition of the existing Westway Terminal site. This development would include the construction of new building for NOAA operations, the use of existing berthing space for research vessels, and the construction of a new building to host "the largest wave tank facility in the world."

Appendix D provides a detailed summary of project components by each of the two phases.

## STUDY SCOPE

The scope of work for this study was developed in conjunction with the Los Angeles Department of Transportation (LADOT). The base assumptions and technical methodologies were discussed as part of the study approach. The study analyzes potential project-generated traffic impacts on the adjacent street system for three peak hours against existing conditions and three future horizon years. The analysis of future year traffic forecasts is based on projected conditions in years 2016, 2024 and 2042, both without and with the addition of project traffic. The following traffic scenarios were analyzed for the weekday morning (between 7:00 and 10:00 AM) and evening (between 3:00 and 6:00 PM) peak hours and weekend midday peak hour (between 11:00 AM and 2:00 PM):

- Existing (Year 2011) Conditions – The analysis of existing Year 2011 traffic conditions provides a basis for the remainder of the study. The existing conditions analysis includes an assessment of streets, traffic volumes, and operating conditions. The existing traffic conditions are the baseline for assessing the significance of project impacts under the California Environmental Quality Act (CEQA).

- Existing (Year 2011) plus Project Conditions – This is an analysis of existing traffic conditions with traffic expected from the proposed project added to the traffic volumes. This is assessed under stabilized project attendance conditions.

- Cumulative Base Conditions – Future traffic conditions are projected without the proposed project in the opening year 2016 and cumulative conditions in 2024 and 2042. The objective of this phase of analysis is to project future traffic growth and operating conditions that could be expected to result from regional ambient growth and known cumulative projects if the proposed project were not developed. The cumulative base traffic forecasts are used to develop cumulative baseline operating conditions that provide the basis for determining cumulative project impacts under CEQA.

- Cumulative plus Project Conditions – This is an analysis of future traffic conditions with traffic expected from the proposed project added to the cumulative base traffic forecasts. Cumulative plus proposed project conditions were developed for years 2016, 2024 and 2042. The objective of this analysis is to develop the traffic forecasts of the proposed project that are then used to identify potential impacts.

Figure 2 shows location of study intersections in the study area. As shown, 19 intersections were identified, for weekday morning and afternoon and weekend midday peak hour analysis as part of the scope of work for this project.

| 16 | Harbor Boulevard & 6th Street |
| 17 | Harbor Boulevard & 7th Street |
| 18 | Miner Street & 22nd Street |
| 19 | Signal Street & 22nd Street (Unsignalized) |

This report is divided into seven chapters, including this introduction (Chapter I). Chapter II describes the existing conditions in the study area including an inventory of the streets, highways, and transit service in the study area, a summary of traffic volumes and an assessment of operating conditions. The methodologies used to develop traffic forecasts for the existing plus project, cumulative base and cumulative plus project are included in Chapter III. Chapter IV presents an assessment of potential intersection traffic impacts generated by the proposed project. The results of the regional transportation system analysis are provided in Chapter V. Chapter VI provides an analysis of parking proposed for the project. Chapter VII summarizes the key findings and conclusions of the study. Appendices to this report include details of the technical analysis.

[1] Per LADOT traffic study guidelines, a significant impact analysis was not conducted for the unsignalized intersections. A warrant analysis was conducted to determine if any of the unsignalized intersection meet City's signal warrants criteria.

**FIGURE 2**

# II. EXISTING CONDITIONS

A comprehensive data collection effort was undertaken to develop a detailed description of existing conditions in the study area. The assessment of conditions relevant to this study includes an inventory of the street and highway systems, traffic volumes on these facilities, and operating conditions at key intersections. A detailed description of these elements in presented in this chapter.

## EXISTING HIGHWAY AND STREET SYSTEM

The project site is in the San Pedro community of the City of Los Angeles. Primary regional access to the project area is provided by the Harbor Freeway (I-110) northwest of the project site and by the Vincent Thomas Bridge and Seaside Avenue (SR-47) northeast of the project site. Year 2009 data from the California Department of Transportation (Caltrans) shows that the average daily traffic (ADT) volume on the Harbor Freeway to the north of Gaffey Street was approximately 66,000 vehicles per day (vpd) and 50,000 vpd on the Vincent Thomas Bridge (*2009 Traffic Volumes on California State Highways,* California Department of Transportation, obtained November 2011). From SR-47, the project site can be accessed via ramps on Harbor Boulevard.

Local access to the project site is provided by a well-defined grid of arterial and collector roads. The primary roadway facilities in the project study area are:

- Gaffey Street – Gaffey Street is classified as a Major Class II Highway that runs north/south in the study area. This arterial provides a connection for local and regional travel from San Pedro to other parts of Los Angeles and the South Bay region. Gaffey Street is a major commercial corridor within San Pedro.

- Harbor Boulevard/Miner Street – Harbor Boulevard is classified as a Major Class II Highway and provides north/south access along the eastern edge of the San Pedro community. It continues as Front Street north of the site and as Miner Street south of Crescent Avenue.

- Via Cabrillo Marina – Via Cabrillo Marina is classified as a Local Street and provides north/south access along the eastern edge of San Pedro from the Cabrillo Marina. The four-lane divided roadway terminates at 22nd Street.

- Signal Street – Signal Street is a Local Street providing north/south access in San Pedro. It is a two lane-undivided roadway, which continues as Sampson Way north of its intersection with 22nd Street.

- Summerland Avenue – Summerland Avenue is classified as a Secondary Highway and provides east/west access in San Pedro. It is a two-lane undivided roadway between its terminus to the west at Western Avenue and to the east at its terminus with Gaffey Street/Gaffey Place.

- O'Farrell Street – O'Farrell Street is classified as a Collector Street and provides east/west access in San Pedro. It is a predominantly residential corridor. The two-lane roadway terminates in the east at Harbor Boulevard and in the west terminates at Gaffey Street.

- 1st Street – 1st Street is classified as a Secondary Highway that provides east/west access in San Pedro. It is a predominantly residential corridor in San Pedro. The two-lane roadway terminates in the east at Harbor Boulevard and in the west terminates at Miraleste Drive.

- 3rd Street – 3rd Street is classified as a Collector Street and provides east/west access in San Pedro. It is a predominantly residential corridor with one travel lane in each direction. 3rd Street terminates to the east at Harbor Boulevard and to the west at South Harbor View Avenue.

- 5th Street – 5th Street is classified as a Secondary Highway and provides east/west access in San Pedro. 5th Street has a mix of commercial and residential land uses. The two-lane undivided roadway terminates to the west at South Bandini Street and to the east at Harbor Boulevard. 5th Street provides access directly to the Port of Los Angeles and the Maritime Museum parking lot.

- 6th Street – 6th Street is classified as a Local Street and provides east/west access in San Pedro. The two-lane undivided roadway extends from Weymouth Avenue eastbound to Sampson Way. Development along 6th Street is predominantly commercial east of Gaffey Street, and residential in nature west of Gaffey Street.

- 7th Street – 7th Street is classified as a Secondary Highway between Weymouth Avenue and Harbor Boulevard and provides east/west access through the central portion of the community of San Pedro. This roadway starts just east of Western Avenue and terminates at Harbor Boulevard.

- 9th Street – 9th Street is classified as a Major Class II Highway between Western Avenue and Pacific Avenue, providing east/west access through the central portion of the community of San Pedro. Between Pacific Avenue and Beacon Street, it is classified as a Local Street. This roadway starts west of Western Avenue and terminates at Beacon Street, one block west of Harbor Boulevard.

- 22nd Street – 22nd Street is classified as a Secondary Highway east of Gaffey Street and as a Local Street west of Gaffey Street. 22nd Street has a mix of residential and commercial land uses, and is a two-lane undivided roadway. 22nd Street extends from Elanita Drive eastbound to Signal Place.

- 25th Street – 25th Street is classified as a Major Class II Highway providing east/west access through the southern portion of the community of San Pedro. This roadway starts west of Western Avenue and terminates at Pacific Avenue.

Diagrams of the existing lane configurations at the analyzed intersections are provided in Appendix A.

## EXISTING TRANSIT SERVICE

The project study area is served by bus transit lines operated by the Los Angeles County Metropolitan Transportation Authority (Metro), LADOT, and the Municipal Area Express (MAX) lines. To complement the traditional transit service in the study area, the Port operates the Waterfront Red Car Line, a historic streetcar line. The following transit routes provide service in the project vicinity:

- Metro Line 205 – Metro Line 205 travels along 1st Street, Harbor Boulevard, 7th Street, Pacific Avenue, and 13th Street in the vicinity of the project site. Line 205 provides service between San Pedro and the Metro Green Line Imperial/Wilmington Station with stops in Compton, Carson, and the Willowbrook and Harbor Gateway communities. Line 205 provides service from approximately 5:00 AM to midnight on weekdays, and from 5:00 to 11:15 AM on weekends and holidays. Bus headways are 30 to 60 minutes on weekdays and 60 minutes on weekends.

- Metro Line 246 – Metro Line 246 operates on Pacific Avenue in the vicinity of the project site. Line 446 provides service between San Pedro and Gardena, where it terminates at the Artesia Transit Center. Line 246 provides service from approximately 4:00 AM to 2:00 AM on weekdays and

weekends. Bus headways are 30 to 60 minutes on weekdays and Saturdays, and hourly on Sundays and holidays.

- Metro Line 450 – Metro Line 450 travels along 22nd Street, Gaffey Street, 19th Street, Pacific Avenue, 1st Street, and Harbor Boulevard in the vicinity of the project site. Line 450 provides service between San Pedro and Downtown Los Angeles, with stops in Gardena and Carson. Line 450 provides service from approximately 5:00 AM to 9:00 PM on weekdays and Saturdays and 7:00 AM to 9:00 PM on Sundays and holidays. Line 450 operates at 30- to 60-minute headways on weekdays, 40-minute headways on Saturdays, and 60-minute headways on Sundays and holidays. From San Pedro, this line provides freeway express service via the Harbor Transitway (on I-110) to the 7th Street/Metro Center station in downtown Los Angeles.

- Metro Line 550 – Line 550 travels along Gaffey Street, 7th Street and 13th Street in the study area. It operates from 5:00 AM to 11:45 PM on weekdays, and from 6:00 AM to 11:45 PM on weekends and holidays, with headways of approximately 30- to 60-minute headways on weekdays and 60-minute headways on weekends. This line provides express connection from San Pedro to West Hollywood.

- LADOT Commuter Express Line 142 – Line 142 travels along 7th Street in the vicinity of the project site. This line provides service between Ports O' Call in east San Pedro, downtown San Pedro, and the Long Beach Transit Center via the Vincent Thomas Bridge. The line runs from approximately 5:30 AM to 11:30 PM, seven days a week, with frequencies of 25 to 60 minutes.

- DASH San Pedro – This line travels along Gaffey Street, 7th Street, and 19th Street near the project site. This route provides local service in the community of San Pedro. The line runs from 6:30 AM to 7:30 PM on Monday through Friday, and from 9:00 AM to 6:30 PM on weekends and holidays. Service frequencies are 20 to 30 minutes.

- Waterfront Red Car Line – This local line is a 1.5-mile historic streetcar line connecting the World Cruise Center with attractions along the San Pedro waterfront in the vicinity of the project site. Hours of operation are from 12:00 noon to 9:30 PM Friday through Sunday, with service every 20 minutes. Red Cars also run on mid-week days when cruise ships are in Port.

- MAX Line 3 – This line travels along 9th Street and Pacific Avenue in San Pedro. It is a directional express line that brings passengers from the South Bay to the El Segundo and Los Angeles International Airport (LAX) area. The weekday morning northbound route has four buses with frequencies of 20 to 30 minutes starting at 5:20 AM. The afternoon southbound route also has four buses with frequencies of 20 to 30 minutes starting at 5:03 PM.

- MAX Line 3X – This line travels along Pacific Avenue and Gaffey Street near the project site. It is a directional express line that brings passengers from the South Bay to the El Segundo and LAX area. The weekday morning northbound route has four buses with frequencies of approximately 20 minutes starting at 6:00 AM. The afternoon southbound route also has four buses with frequencies of approximately 30 minutes starting at 4:36 PM.

## EXISTING TRAFFIC VOLUMES AND LEVELS OF SERVICE

This section presents the existing peak hour turning movement traffic volumes for the analyzed intersections, describes the methodology used to assess the traffic conditions at each intersection, and analyzes the resulting operating conditions at each, indicating volume-to-capacity (V/C) ratios and level of service (LOS).

### *Existing Traffic Volumes*

New traffic counts were conducted for the weekday morning peak period (between 7:00 and 10:00 AM), the evening peak period (between 3:00 and 6:00 PM) and the Saturday midday peak period (between 11:00 AM and 2:00 PM) in April 2011 on days when the cruise ships were present at the World Cruise Center. The existing weekday and Saturday peak hour traffic volumes at the analyzed intersections are presented in Figure 3. Traffic count data sheets are provided in Appendix B.

### *Level of Service Methodology*

LOS is a qualitative measure used to describe the condition of traffic flow, ranging from excellent "free-flow" conditions at LOS A to overloaded "stop-and-go" conditions at LOS F. LOS D is typically considered to be the minimum acceptable level of service in urban areas.

According to *Traffic Study Policies and Procedures* (LADOT, August 2011), this study is required to use the Critical Movement Analysis (CMA) method of intersection capacity calculation (Transportation Research Circular No. 212, Transportation Research Board, 1980) to analyze the LOS at signalized intersections. The CMA methodology determines the V/C ratio of an intersection based on the number of approach lanes, the traffic signal phasing and the traffic volumes. The CMA worksheet developed by LADOT was used to implement the CMA methodology in this study. The V/C ratio is then used to find the corresponding LOS based on the definitions in Table 1.

Sixteen of the 19 analyzed intersections are currently controlled by traffic signals. All but two of these intersections are currently controlled by the City's Automated Traffic Surveillance and Control (ATSAC) and Adaptive Traffic Control System (ATCS) system. The intersections of I-110 Eastbound Ramps/Swinford Street & Harbor Boulevard/Front Street and Miner Street & 22nd Street currently do not have ATSAC and ATCS installed. In accordance with LADOT procedures, a capacity increase of 10% was applied to reflect the benefits of ATSAC (7% credit) and ATCS (3% credit) in locations where these signals are installed.

Three study intersections, Harbor Boulevard & SR-47 Westbound On-Ramp, Harbor Boulevard & 3rd Street, and Signal Street & 22nd Street are unsignalized and were analyzed for information purposes using the stop-controlled methodologies from *Highway Capacity Manual* (Transportation Research Board, 2000), which determines the average vehicle delay and the LOS using the relationship. The results of the analysis of these three unsignalized intersections are presented in Appendix E.

### *Existing Peak Hour Levels of Service*

The existing weekday and weekend peak hour turning movement volumes presented in Figure 3 were used in conjunction with the LOS methodology described above to determine existing operating conditions at each of the study intersections. LOS calculation worksheets are included in Appendix C.

**TABLE 1**
**LEVEL OF SERVICE DEFINITIONS**
**FOR SIGNALIZED INTERSECTIONS**

| Level of Service | Intersection Capacity Utilization | Definition |
|---|---|---|
| A | 0.000-0.600 | EXCELLENT. No Vehicle waits longer than one red light and no approach phase is fully used. |
| B | 0.601-0.700 | VERY GOOD. An occasional approach phase is fully utilized; many drivers begin to feel somewhat restricted within groups of vehicles. |
| C | 0.701-0.800 | GOOD. Occasionally drivers may have to wait through more than one red light; backups may develop behind turning vehicles. |
| D | 0.801-0.900 | FAIR. Delays may be substantial during portions of the rush hours, but enough lower volume periods occur to permit clearing of developing lines, preventing excessive backups. |
| E | 0.901-1.000 | POOR. Represents the most vehicles intersection approaches can accommodate; may be long lines of waiting vehicles through several signal cycles. |
| F | > 1.000 | FAILURE. Backups from nearby locations or on cross streets may restrict or prevent movement of vehicles out of the intersection approaches. Tremendous delays with continuously increasing queue lengths. |

Notes: Intersections analyzed using LADOT CMA analysis methodology.

[1] - CMA analysis was not conducted for the three unsignalized intersections: Intersections #10 - Harbor Blvd & SR-47 Ramps; Intersection #14 - Harbor Blvd & 3rd St; and Intersection # 19 - Signal St & 22nd St. These intersections were analyzed using Highway Capacity Manual (2000) methodology. Results of the LOS analysis are provided in the appendix.

# III. TRAFFIC PROJECTIONS

## PROJECT TRAFFIC VOLUMES

Development of the traffic generation estimates for the proposed project involved a three-step process including traffic generation, trip distribution, and traffic assignment.

### *Project Traffic Generation*

Trip generation rates and equations from *Trip Generation, 8th Edition* and other sources were used to develop trip generation estimates for the proposed project. The trip generation estimates proposed project is summarized in Table 3 for the interim Year 2016, the full buildout Year 2024, and end-of-lease term Year 2042. When a land use proposed as part of the project had an associated trip generation rate in *Trip Generation, 8th Edition*, that rate was used.

Trip generation rates for the boat slips on the East Channel were developed based on the following assumptions:

- Two external crew members making two round-trip commute trips would be necessary to serve the vessel.
- One daily round trip truck trip would be necessary to serve the vessel.
- All researchers on the vessel would be accounted for in trip generation for office/lab/classroom uses.
- All weekday vehicle trips would be made outside AM and PM peak hours.
- Outbound trips for crew would occur during the weekend midday peak hour.
- Six vessel sailings per day (half of the 12 small vessel slips would be used per weekday) on weekdays and three on weekend days (one quarter of the 12 small vessel slips would be used per weekend day).

Trip generation rates for the Public Plaza were developed using the *San Diego Land Development Code Trip Generation Manual* (City of San Diego, 2003). In order to provide a conservative estimate of potential traffic impacts of the proposed project, no adjustments were made to account for possible reductions due to either pass-by trips or internal capture with the exception of the small waterfront café, which would generally serve City Dock users.

In 2016, as shown in Table 3, the project is estimated to generate a total of approximately 1,046 daily weekday trips, including approximately 102 (83 inbound/19 outbound) trips during the AM peak hour and 96 (22 inbound/74 outbound) trips during the PM peak hour. The project is projected to generate approximately 518 daily weekend trips, including 53 (32 inbound/21 outbound) trips during the weekend peak hour.

In 2024, as shown in Table 3, using the same methodology as described above, the proposed project is projected to generate approximately 2,935 daily weekday trips, including approximately 384 (318 inbound/66 outbound) trips during the AM peak hour and 343 (60 inbound/283 outbound) trips during the PM peak hour. The project is projected to generate approximately 997 daily weekend trips, including 112 (77 inbound/35 outbound) trips during the weekend peak hour.

Notes:
KSF = 1,000 square feet
[1] = Square footage of approximately 9.87 ksf is reflected in seat count per NOP

### *Project Traffic Distribution*

The geographic distribution of trips generated by the proposed project is dependent on characteristics of the street system serving the site, the level of accessibility of routes to and from the proposed project site, the locations of employment and commercial centers to which residents of the project would be drawn, and the geographic distribution of population from which employees and potential patrons of the proposed commercial elements of the project would be drawn. The general distribution pattern used in this study was developed in consultation with LADOT and is illustrated in Figure 4.

### *Project Traffic Assignment*

The trip generation estimates for Phase 1 and Phase 2 conditions summarized in Table 3 and the distribution patterns illustrated in Figure 4 were used to assign the project-generated traffic to the local and regional street system. Figures 5 and 6 illustrate the estimated project-generated peak hour traffic volumes at each of the analyzed intersections during a typical weekday morning and evening peak hour and weekend midday peak hour, for opening year and stabilized year, respectively. Project traffic assignment for years 2024 and 2042 account for the proposed reconfiguration of Harbor Boulevard south of 7$^{th}$ Street, which will include a junction with Sampson Way.

## EXISTING PLUS PROJECT TRAFFIC PROJECTIONS

The proposed project traffic volumes for both Phase 1 and Phase 2 were added to the 2011 traffic counts to develop the existing plus project traffic volumes. Figure 7 illustrates the resulting projected existing plus project peak hour traffic volumes for a typical weekday AM and PM peak hour and weekend peak hour with Phase 1 developed, and Figure 8 illustrates the Existing plus Project conditions with the addition of Phase 2 project trips.

## FUTURE BASE TRAFFIC VOLUMES

The future base traffic projections reflect the changes to existing traffic conditions expected from: (1) ambient growth in traffic, which reflects increases in traffic because of regional growth and development; (2) traffic generated by specific development projects located in, or in the vicinity of, the study area; and (3) roadway or intersection capacity enhancements. These factors are described below.

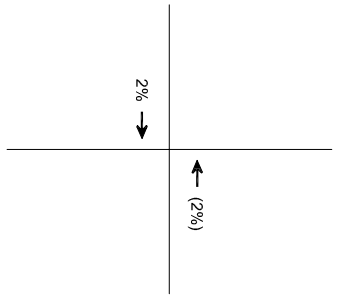
### *Areawide Traffic Growth*

Regional background (ambient) traffic growth was estimated using data from a computerized traffic analysis tool known as the Port Area Travel Demand Model, which includes traffic growth for the port and the local area. Background traffic growth occurs as a result of regional growth in employment, population, schools, and other activities. Related projects are covered by the growth forecasts of the Port Travel Demand Model. Local projects not included in the SCAG Regional Travel Demand Forecasting Model were separately accounted for in the Port Travel Demand Model, such as detailed Ports of Long Beach and Los Angeles projected container and non-container terminal growth and the Wilmington Waterfront.

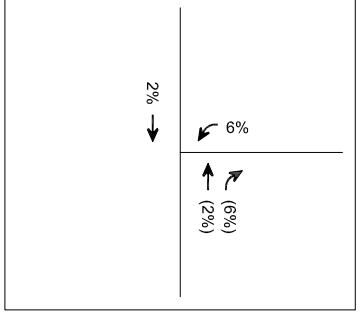
### *Related Project Traffic Generation and Assignment*

Future base traffic forecasts include the effects of specific cumulative development projects, also called related projects, expected to be built in the vicinity of the proposed project site prior to the proposed project's future years of 2016, 2024 and 2042. The following projects were included in the related project traffic generation and assignment:

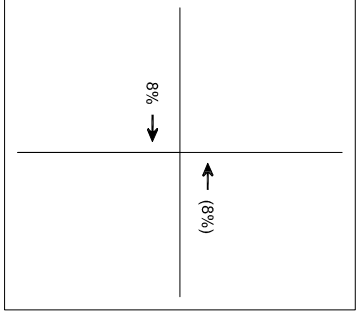
1. Gaffey St & Summerland Av



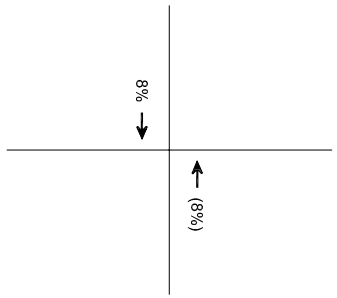
2. Gaffey St & I-110 Ramps



3. Gaffey St & 1st St



4. Gaffey St & 5th St



5. Gaffey St & 7th St

- CRAFTED in San Pedro (Warehouses #9 and #10) – CRAFTED would be located in Warehouses #9 and #10 in San Pedro, near Miner Street & 22nd Street, approximately 1.5 miles from the project site. This project would consist of adaptive reuse of the existing warehouses to create a permanent craft marketplace. The building programming would be composed of juried vendor stalls selling handmade wares. The building would also feature concession areas and a demonstration area. CRAFTED would be open throughout the week, with peak activity occurring on weekends.

- USS Iowa – USS Iowa would be located at City Dock #1 would be located at Berth 87, near the intersection of Harbor Boulevard & 1st Street, approximately 1.5 miles from the project site. This project consists of a 33,800-square foot visitor center, including a museum and education center aboard the USS Iowa battleship. There would also be concession areas, ticketing and gift-shop facilities on the project site.

- San Pedro Waterfront – The San Pedro waterfront transformation is a long-range specific plan for the San Pedro side of the Los Angeles waterfront. It includes redevelopment of Ports O'Call, the primary retail outlet along the waterfront, additional promenades and boat harbors, and several recreational elements. The project is expected to increase utilization of the Waterfront area with adaptive reuse of underutilized buildings and new development opportunities along the waterfront.

***Future Baseline Street Improvements***

Per information received from POLA, a future improvement along Harbor Boulevard (expected by year 2016) to the intersection of Harbor Boulevard & 7th Street will include a junction with Sampson Way. By year 2024, as part of the San Pedro Waterfront Project: Harbor Boulevard will be re-striped, and the median will be removed/reconstructed as needed to provide three northbound through and southbound through lanes between the reconstructed Sampson Way & Harbor Boulevard intersection and the Westbound On-Ramp & Front Street intersection. This will result in the removal of parking and the bike lane on the northbound side. However, the existing and planned promenade on the east side of Harbor Boulevard will provide the replacement bike lane. The parking and 5' bike lane on the southbound side south of O' Farrell Street will be preserved (this is predicated upon 10' interior lanes, with the exception of the outer southbound through lane, adjacent to the bike lane, which would be maintained at 11' wide). North of O'Farrell Street, the parking and parking lane on the southbound side would need to be removed to accommodate the northbound dual left-turn lane. The innermost northbound through lane at the eastbound off-ramp intersection would become a forced left-turn lane at the SR 47 Westbound On-Ramp. This improvement is projected to be needed by the year 2024. The POLA will monitor operational conditions on an ongoing basis to confirm the need and timing for these improvements.

Additionally, the current improvement plan would equip all remaining intersections with ATSAC and install the state-of-the-art Adaptive Traffic Control System (ATCS) as an additional feature of the ATSAC system. In the analysis of future operating conditions, a capacity increase of 10% (0.10 V/C adjustment) was applied to reflect the benefit of ATSAC/ATCS control at all signalized study intersections.

These improvements would result in capacity changes at the specified locations throughout the study area. Future lane geometries are included in Appendix A of this report.

***Traffic Assignment***

Using the estimated trip generation and trip distribution patterns described above, traffic generated by the related projects was assigned to the street network.

***Future Base Traffic Projections***

Figures 9, 10, and 11 illustrate the future base for the future Years 2016, 2024, and 2042 at the analyzed intersections for weekday morning and evening peak and weekend afternoon peak hours. The future base traffic conditions represent an estimate of future conditions without development of the proposed project.

## FUTURE PLUS PROJECT TRAFFIC PROJECTIONS

The proposed project traffic volumes were then added to the future base traffic projections to develop the future plus project traffic forecasts for years 2016, 2024 and 2042. Figure 12 illustrates the resulting projected future plus project peak hour traffic volumes for a typical weekday AM and PM peak hour and weekend PM peak hour in 2016. Figure 13 illustrates the resulting projected future plus project peak hour traffic volumes for a typical weekday AM and PM peak hour and weekend peak hour in 2024, with the inclusion of project traffic. Finally, Figure 14 shows information for 2042. These volumes represent future traffic conditions following completion of the proposed project for the three future analysis years.

# IV. LEVEL OF SERVICE AND SIGNIFICANT IMPACT ANALYSIS

This section presents an analysis of the existing and future without and with project volumes to determine the potential traffic impacts of the proposed project on the operating conditions of the surrounding street system. The traffic impact analysis compares the projected LOS at each study intersection under existing and future plus project conditions to the existing and future base conditions to estimate the increase in the V/C ratio caused by the proposed project. This provides the information needed to assess the potential impact of the project using significance criteria established by LADOT. Detailed LOS calculations for the proposed project for Existing plus Project and future years 2016, 2024, and 2042 are included in Appendix C.

## CRITERIA FOR DETERMINATION OF SIGNIFICANT TRAFFIC IMPACT

All study intersections are in the City of Los Angeles. Significance criteria established by the City of Los Angeles was used to assess the potential for significant project impacts at the study intersections.

The City of Los Angeles has established threshold criteria to determine significant traffic impact of a proposed project in its jurisdiction. Under the LADOT guidelines, an intersection would be significantly impacted with an increase in V/C ratio equal to or greater than 0.04 for intersections operating at LOS C, equal to or greater than 0.02 for intersections operating at LOS D, and equal to or greater than 0.01 for intersections operating at LOS E or F after the addition of project traffic. Intersections operating at LOS A or B after the addition of the project traffic are not considered significantly impacted regardless of the increase in V/C ratio. The following summarizes the impact criteria:

| LOS | Final V/C Ratio | Project-related Increase in V/C |
|---|---|---|
| C | >0.700 - 0.800 | equal to or greater than 0.040 |
| D | > 0.800 - 0.900 | equal to or greater than 0.020 |
| E or F | > 0.900 | equal to or greater than 0.010 |

## LEVEL OF SERVICE ANALYSIS

### *Existing plus Project (Phase 1) Traffic Conditions*

The resulting existing plus project peak hour traffic volumes with Phase 1 of development, illustrated in Figure 7, were analyzed to determine the projected existing operating conditions with the addition of the proposed project traffic. The results of the existing plus project analysis are presented in Table 4. As indicated in the table, all 16 signalized intersections operate at LOS D or better during both peak hours.

### *Project Intersection Impacts – Existing plus Project (Phase 1)*

To determine whether significant impacts would occur at the study intersections, the existing plus project operating conditions were compared to the existing operating conditions. As shown in Table 4, using the City of Los Angeles criteria for determination of significant impacts, under Existing Conditions with opening year attendance, the proposed project will not result in any significant impacts.

Source: Fehr & Peers, 2011

Notes: Intersections analyzed using LADOT CMA analysis methodology and significance criteria.

[1] - Significant Impact analysis was not conducted for the three unsignalized intersections: Intersections #10 - Harbor Blvd & SR-47 Ramps; Intersection #14 - Harbor Blvd & 3rd St; and Intersection # 19 - Signal St & 22nd St. These intersections were analyzed using Highway Capacity Manual (2000) methodology. Results of the LOS analysis are provided in the appendix.

***Existing plus Project (Phase 2) Traffic Conditions***

The resulting existing plus project peak hour traffic volumes with Phase 2 of development, illustrated in Figure 8, were analyzed to determine the projected existing operating conditions with the addition of the proposed project traffic. The results of the existing plus project analysis are presented in Table 5. As indicated in the table, all 16 signalized intersections operate at LOS D or better during both peak hours.

***Project Intersection Impacts – Existing plus Project (Phase 2)***

To determine whether significant impacts would occur at the study intersections, the existing plus project operating conditions were compared to the existing operating conditions. As shown in Table 5, using the City of Los Angeles criteria for determination of significant impacts, under Existing Conditions with opening year attendance, the proposed project will not result in any significant impacts.

***Future Base (Year 2016) Traffic Conditions***

Future (year 2016) base traffic projections presented in Figure 9 were analyzed to establish future (year 2016) base operating conditions without the project. As shown in Table 6, 15 of the 16 signalized intersections operate at LOS D or better during both peak hours. The following intersections are projected to operate at LOS E or worse during one or more analyzed peak hours:

- Summerland Avenue & Gaffey Street (weekday PM only)

***Future Base (Year 2024) Traffic Conditions***

Future (Year 2024) base traffic projections presented in Figure 10 were analyzed to establish future (Year 2024) base operating conditions without the project. As shown in Table 7, 14 of the 16 signalized intersections operate at LOS D or better during both peak hours. The following intersections are projected to operate at LOS E or worse during one or more analyzed peak hours:

- Summerland Avenue & Gaffey Street (weekday PM only)
- 1st Street & Gaffey Street (weekday AM and PM peak hours)

***Future Base (Year 2042) Traffic Conditions***

Future (Year 2042) base traffic projections presented in Figure 11 were analyzed to establish future (year 2042) base operating conditions without the project. As shown in Table 8, 14 of the 16 intersections operate at LOS D or better during both peak hours. The following intersections are projected to operate at LOS E or worse during one or more analyzed peak hours:

- Summerland Avenue & Gaffey Street (weekday PM only)
- 1st Street & Gaffey Street (both weekday AM and PM and weekend midday peak hours)

Source: Fehr & Peers, 2011

Notes: Intersections analyzed using LADOT CMA methodology and significance criteria.

[1] - Significant Impact analysis was not conducted for the three unsignalized intersections: Intersections #10 - Harbor Blvd & SR-47 Ramp; Intersection #14 - Harbor Blvd & 3rd St; and Intersection #19 - Signal St & 22nd St. These intersections were analyzed using Highway Capacity Manual (2000) methodology. Results of the LOS analysis are provided in the appendix.

***Future (Year 2016) plus Project (Phase 1) Traffic Conditions***

The resulting 2016 cumulative plus project peak hour traffic volumes, illustrated in Figure 12, were analyzed to determine the projected future operating conditions with the addition of the proposed project traffic. The results of the cumulative plus project analysis are presented in Table 6. As indicated in the table, the intersection of Summerland Avenue & Gaffey Street would operate at LOS E or worse during one or more analyzed peak hours.

***Project Intersection Impacts Year 2016***

To determine whether significant impacts would occur at the study intersections, the 2016 plus project operating conditions were compared to the 2016 base operating conditions. As shown in Table 6, using the City of Los Angeles criteria for determination of significant impacts, the proposed project would not result in any significant impacts with the addition of project traffic.

***Future (Year 2024) plus Project Traffic Conditions***

The resulting future (year 2024) plus project peak hour traffic volumes, illustrated in Figure 13, were analyzed to project future operating conditions with the addition of the proposed project traffic. As shown in Table 7. As indicated in the table, the following two intersections are projected to operate at LOS E or worse during one or more peak hours:

- Summerland Avenue & Gaffey Street (weekday PM only)
- 1st Street & Gaffey Street (both weekday AM and PM peak hours)

***Project Intersection Impacts Year 2024***

To determine whether significant impacts would occur at the study intersections, the future plus project operating conditions were compared to the future base operating conditions. As shown in Table 7, using the City of Los Angeles criteria for determination of significant impacts, the project would not result in a significant impact at any of the analyzed intersections.

***Future (Year 2042) plus Project Traffic Conditions***

The resulting future (Year 2042) plus project peak hour traffic volumes, illustrated in Figure 14, were analyzed to project future operating conditions with the addition of the proposed project traffic. As shown in Table 8, the following two intersections operate at LOS E or worse during one or more peak hours:

- Summerland Avenue & Gaffey Street (weekday PM only)
- 1st Street & Gaffey Street (both weekday AM and PM and weekend midday peak hours)

***Project Intersection Impacts Year 2042***

To determine whether significant impacts would occur at the study intersections, the cumulative plus project operating conditions were compared to the cumulative base operating conditions. As shown in Table 8, using the City of Los Angeles criteria for determination of significant impacts, there are no significant impacts under this scenario.

# IV. CONGESTION MANAGEMENT PROGRAM ANALYSIS

This chapter presents the regional transportation system impact analysis conducted in accordance with the procedures outlined in 2010 Congestion Management Program for Los Angeles County (Metro, October 2010). The CMP requires that when an environmental impact report is prepared for a project, traffic impact analyses be conducted for select regional facilities based on the quantity of project traffic expected to use these facilities.

## REGIONAL TRAFFIC IMPACT ANALYSIS

The CMP guidelines require that the first issue to be addressed is the determination of the geographic scope of the study area. The criteria for determining the study area for CMP arterial monitoring intersections and for freeway monitoring locations are:

- All CMP arterial monitoring intersections where the proposed project will add 50 or more trips during either the AM or PM peak hours of adjacent street traffic.

- All CMP mainline freeway monitoring locations where the proposed project will add 150 or more trips, in either direction, during either the AM or PM peak hours.

The CMP traffic impact analysis guidelines establish that a significant project impact occurs when the following threshold is exceeded:

- The proposed project increases traffic demand on a CMP facility by 2% of capacity (V/C 0.02), causing LOS F (V/C > 1.00).

- If the facility is already at LOS F, a significant impact occurs when the proposed project increases traffic demand on a CMP facility by 2% of capacity (V/C 0.02).

### *Arterial Monitoring Station Analysis*

The CMP arterial monitoring stations nearest to the project study area include:

- Gaffey Street & 9th Street (study intersection #6)
- Western Avenue & 9th Street

This project would add fewer than 50 vehicle trips through these arterial monitoring stations, so no further analysis of CMP arterial intersections is required and CMP arterial intersection impacts are considered to be less than significant.

### *Freeway Mainline Monitoring Station Analysis*

This section presents an analysis of potential project impacts on the regional transportation system. This analysis was conducted in accordance with the transportation impact analysis procedures outlined in the CMP. The nearest CMP mainline freeway monitoring location nearest to the project site is: I-110 south of C Street. According to the incremental project trip generation estimates developed in Chapter III and the project only traffic volumes illustrated in Figures 5 and 6, the proposed project is not expected to add sufficient new traffic to exceed the freeway analysis criteria at these locations.

Since incremental project-related traffic in any direction during either peak hour is projected to be less than the minimum criteria of 150 vph, no further CMP freeway analysis is required and CMP freeway impacts are considered to be less than significant.

## REGIONAL TRANSIT IMPACT ANALYSIS

Potential increases in transit person trips generated by the proposed project were estimated as follows. Section B.8.4 of the CMP provides a methodology for estimating the number of transit trips expected to result from a proposed project based on the projected number of vehicle trips. The CMP requires that the transit impact analysis include local services within ¼ mile of the project and express bus and rail routes within two miles of the project. Potential increases in transit person trips generated by the proposed project were evaluated based on the CMP methodology. This methodology assumes an Average Vehicle Ridership (AVR) factor of 1.4 to estimate the number of person trips to and from the project and then provides guidance regarding the percent of person trips assigned to public transit depending on the type of use (commercial/other; residential) and its proximity to transit services.

There are no local buses and there is one fixed-route transit line (Waterfront Red Car) within ¼ mile of the project area, and four fixed-route express bus lines (Metro 450, Metro 550, DOT Commuter Express 142 and MAX 3X) within two miles of the project area. Assuming an average bus seating capacity of 30 or 40 seats, the total number of seats during peak hours is about 660.

The proposed project generates the highest number of trips during the weekday AM peak hour. By multiplying the AM peak hour trips by an AVR of 1.4 it is estimated that the proposed project could generate a total of 143 person trips in Phase 1 and 538 person trips in Phase 2.

Since the project area does not qualify as a CMP transit center, a CMP multi-modal transportation center, or a CMP transit corridor under Existing (Year 2011) conditions, a factor of 3.5% was applied to person trips generated to estimate transit trips (based on CMP guidelines). The project would therefore generate five transit trips (less than one transit trip per vehicle) under Phase 1 and 19 transit trips (less than two transit trips per vehicle) under Phase 2 during the AM peak hour.

The CMP does not have a threshold for determining the significance of impacts on the transit system, however, at these levels (one to two trips per transit vehicle in the peak hour), project-related impacts on the regional transit system would not be considered significant.

# V. PARKING

A parking analysis was conducted for the proposed project. A total of 619 parking spaces would be available to satisfy the parking demand generated by the proposed project.

## PARKING SUPPLY

The project proposes to provide parking in three locations:

- 15 spaces of surface parking at Berth 56
- 195 spaces of diagonal parking along Signal Street near Berths 57-60
- 409 spaces at the existing surface parking lot at Sampson Way & 22nd Street

## PARKING ANALYSIS

Los Angeles Municipal Code (LAMC) Chapter 1, Article 2, Section 12.21.A.4 identifies off-street parking requirements for new development. The LAMC parking requirements for the project land uses were compiled and are presented in Table 9. As shown in this table, the project requires 613 on-site spaces per LAMC requirements.

The project proposes a total of 619 on-site parking spaces. Thus, the proposed supply is sufficient per LAMC requirements.

# VI. SUMMARY AND CONCLUSIONS

This study was undertaken to analyze the potential for traffic impacts resulting from the proposed development of City Dock No. 1 in the Port of Los Angeles (Port) in Los Angeles, California. The key findings and conclusions of the study are summarized below:

- The proposed project involves the development of a marine research center in the Port of Los Angeles. Project elements would include the relocation of SCMI from its existing location on Terminal Island to Berths 56 and 57, adaptive reuse of the transit sheds at Berths 57 to 60 to accommodate research, teaching and meeting spaces, the establishment of a marine science business park/incubator space, and research and development facilities at Berths 70 to 71.

- Detailed intersection capacity and operation analyses were conducted at 16 signalized intersections in the vicinity of the project site for weekday morning (between 7:00 and 10:00 AM), evening (between 3:00 and 6:00 PM) and Saturday midday peak hours (between 11:00 AM and 2:00 PM). 15 of these signalized study intersections currently operating at an acceptable LOS (LOS D or better). The intersection of 1st Street & Gaffey Street currently operates at LOS E during the weekday morning and evening peak hours.

- Project trip generation estimates were developed using trip generation rates and equations from *Trip Generation, 8th Edition* and supplemented by the San Diego Land Development Code Trip Generation Manual. Under Phase 1 (Year 2016) conditions, the project will generate approximately 1,046 daily weekday trips, including 102 trips during the AM peak hour and 96 trips during the PM peak hour, and 518 daily weekend trips, including 53 during the weekend peak hour.

- By Year 2024, when the project is fully built out, it will generate approximately 2,935 daily weekday trips, including 384 AM peak hour trips and 343 PM peak hour trips, and 997 daily weekend trips, including 112 during the weekend peak hour.

- The project trip assignments for Phase 1 and Phase 2 (Project Buildout) were added to existing weekday morning and evening and Saturday midday peak hour traffic to calculate existing plus project traffic volumes.

- Three future scenarios: Year 2016 (Phase 1); Year 2024 (Phase 2), and Year 2042 (cumulative) were analyzed in the traffic study. Future base projections were developed using the Port Area Travel Demand Model. Specific related project proposed in the vicinity of the project were added on top of the model projection to develop future base line traffic projections. The project traffic volumes were added to the above future base scenarios to calculate future plus project traffic projections.

- Existing plus project, future base and future plus project projections were analyzes using CMA methodology to determine operation conditions at the analyzed intersections.

- Existing plus project LOS results were compared to existing traffic volumes to determine project's incremental impact. Using City of Los Angeles' significant impact criteria, it is determined that there are no significant impacts with the addition of project traffic.

- Future base LOS results were compared to future plus project LOS results to determine project related incremental impact at the analyzed intersections. Using the significant impact criteria, it is determined that the project will not result in any significant impacts at study intersections.

- The project would not result in a significant impact at any CMP roadway and transit facilities.

- Overall, the Project will provide sufficient parking per Los Angeles Municipal Code off-street parking requirements.
