3.6

GROUND TRANSPORTATION AND CIRCULATION

3.6.1 Introduction

This section discusses potential traffic and circulation impacts associated with the proposed Project and its alternatives. The Initial Study (Appendix A) determined that impacts on ground transportation and circulation would be less than significant; however, this issue was raised during public review and is, therefore, evaluated in this Draft Supplemental Environmental Impact Statement/Environmental Impact Report (SEIS/SEIR).

The traffic analysis in this section draws upon information from the Port of Los Angeles Baseline Transportation Study (MMA 2004).

3.6.1.1 Relationship to 1992 Deep Draft Final EIS/EIR

The Deep Draft Final Environmental Impact Statement/Environmental Impact Report (FEIS/FEIR) (United States Army Corps of Engineers) and Los Angeles Harbor Department 1992) evaluated at a project-specific level, and recommended mitigation to the extent feasible for, all significant ground transportation and circulation impacts associated with navigation and landfill improvements required to create Pier 400. This included those portions of the project located on Pier 400. The Deep Draft FEIS/FEIR also assesses on a general, or programmatic, level the foreseeable ground transportation and circulation impacts associated with the development and operation of terminal facilities planned for location on Pier 400, including a marine oil terminal and associated infrastructure. The Deep Draft FEIS/FEIR identified the primary ground transportation and circulation impact of terminal development and operation as resulting from 1) increased employee trips and truck trips associated with each planned increment; 2) increased employee automobile and work truck traffic on local roadways; and 3) increased traffic on railways. The Deep Draft FEIS/FEIR identified a significant and unavoidable impact on transportation, concluding that the Deep Draft project would generate significant quantities of vehicle trips that would be forced on routes that already exceeded roadway capacity or were anticipated to exceed acceptable levels of service prior to implementation of the Deep Draft project.
Potentially significant, but feasibly mitigable, impacts related to traffic generation and development of Pier 400 were also identified, including increased vehicle trips during construction activities, and volume of proposed traffic greater than one percent of projected traffic volumes.

The Deep Draft FEIS/FEIR recommended nine programmatic mitigation measures (MM) (MM 4F-1 through MM 4F-9) that would reduce ground transportation and circulation impacts. It was concluded that with recommended mitigations the residual impacts on the roadways would remain significant. The impact on the railways would not, however, present a significant impact. The Deep Draft FEIS/FEIR evaluated the foreseeable development of the proposed Pier 400 landfill, including construction of a deep-draft marine oil terminal, at a programmatic level; site-specific construction and operations associated with development of Pier 400 were not evaluated in the Deep Draft FEIS/FEIR. Consequently, development of Pier 400 is subject to additional port planning and National Environmental Policy Act (NEPA) and California Environmental Quality Act (CEQA) analysis.

The approved Deep Draft FEIS/FEIR incorporated the Mitigation Measures listed below to minimize impacts on transportation/circulation to the greatest extent feasible. Some of these mitigation measures are applicable to the current proposed Project, while others have already been implemented or do not apply to the proposed Project. Applicable Mitigation Measures from the Deep Draft FEIS/FEIR are listed and discussed below and have been included in the proposed Project Mitigation Monitoring and Reporting Plan (MMRP).

Subsequent to approval of the Deep Draft FEIS/FEIR, the Los Angeles Harbor Department (LAHD) has implemented a variety of programs to reduce environmental effects associated with operations at the Port of Los Angeles (the Port or LAHD). In April 2002, the Alameda Corridor Project, a 20-mile railroad express line that connects the Ports of Los Angeles and Long Beach to the major rail network east of downtown Los Angeles was initiated. The Alameda Corridor Project transports cargo to downtown rail yards at 10 to 15 miles per hour faster than previous railroad operations. In addition, the Alameda Corridor Project eliminated 200 rail/street crossings, including the Pacific Coast Highway Grade Separation that constructed a half mile long bridge which carries Pacific Coast Highway traffic over the Alameda Corridor freight rail expressway and Alameda Street.

Mitigation Measures from the 1992 Deep Draft Final EIS/EIR that are Applicable to the Proposed Project

The following Mitigation Measures were developed in the Deep Draft FEIS/FEIR to reduce the significant impacts to ground transportation. These measures remain applicable to the current proposed Project and have been revised where necessary. The following measures would be adopted by the Port of Los Angeles Board of Harbor Commissioners and would become conditions of proposed Project approval that dictate future development of the proposed Project site:

MM 4F-1: The contractor shall encourage construction workers to carpool by offering various incentives.
MM 4F-2: When possible, trucks that are utilized to bring equipment and materials to the site shall be used to carry off any debris, excess materials, etc.

MM 4F-4: Tenants shall be encouraged to reduce the number of vehicle trips associated with employee vehicles by introducing ridesharing incentives, parking management programs (i.e., parking spaces for ride sharers and removing street parking), auto use restriction programs, and truck movement restriction programs.

MM 4F-5: On-site information on the importance of the reduction in vehicle miles traveled and related air quality impacts shall be provided and literature on rideshare programs shall be dispensed.

Mitigation Measures from the 1992 Deep Draft Final EIS/EIR that are No Longer Applicable or are Not Applicable to the Proposed Project

The 1992 Deep Draft FEIS/FEIR concluded implementation of the following measures would reduce impacts on the local circulation system and minimize adverse impacts associated with increased truck trips on surrounding roadways and freeways. However, for the reasons identified below, these mitigation measures are no longer applicable to the proposed Project.

MM 4F-3: Park-and-ride stations, more bus stops or transit stops, and shuttle services were to be established in the project area.

Reason no longer applicable: This mitigation measure has already been implemented under the Deep Draft program.

MM 4F-6: Consolidation of access routes to the landfill was recommended, including the elevation of Anaheim Street on the a viaduct over Alameda Street, over the north-south Southern Pacific Transportation Company (SPTC) and Atchison, Topeka, and Santa Fe (AT&SF) rail line, over Henry Ford Avenue, and over the new rail yard. The new Anaheim Street viaduct could align with I Street to the east.

Reason no longer applicable: This mitigation was implemented under the Deep Draft program and is not related to the proposed Project because these access routes are not used by the proposed Project.

MM 4F-7: On Terminal Island, a New Dock Street grade separation was recommended to eliminate the conflict between rail and vehicular traffic. A new Seaside Avenue/Navy Way interchange was also recommended as part of the central transportation spine to the landfill.

Reason no longer applicable: This mitigation was implemented under the Deep Draft program and is not related to the proposed Project because no conflicts between rail and vehicular traffic is anticipated.

MM 4F-8: Where possible, work hours and work days were to be flexible or staggered such that haul trucks would access the site during non-peak hours.
3.6 Ground Transportation and Circulation

Reason no longer applicable: This mitigation was implemented under the Deep Draft program and is not related to the proposed Project because this project is forecast to result in one additional truck trip for daily operations.

MM 4F-9: Cooperation between the cities of Los Angeles and Long Beach and with the California Department of Transportation (DOT) was recommended to identify and fund transportation improvements throughout the Port areas and access routes.

Reason not applicable: This mitigation was implemented under the Deep Draft program and is still an ongoing effort.

3.6.2 Environmental Setting

This section evaluates streets and intersections that would potentially be used by both automobile and truck traffic to gain access to and from the Marine Terminal and tank farm sites, as well as those streets that would be used by construction traffic (i.e., equipment and commuting workers). The area of influence evaluated in this Draft SEIS/SEIR refines the general geographic scope that was originally evaluated in the Deep Draft FEIS/FEIR to reflect project-specific construction and operation activities associated with development of Pier 400.

3.6.2.1 Regional and Local Access

Roadways

Regional access to the harbor area is provided by a network of freeways and highways. The freeways in the network consist of the Harbor Freeway (Interstate [I]-110), the Long Beach Freeway (I-710), and the Terminal Island Freeway (State Route [SR] 47/103). The Pacific Coast Highway (Route 1) is also a part of the network. Primary access to the freeways from Terminal Island is via the Terminal Island Freeway and Seaside Avenue/Ocean Boulevard. Three major highway bridges also connect Terminal Island to regional and local streets and highways: the Vincent Thomas Bridge (part of SR 47); the Commodore Schuyler F. Heim Bridge (part of SR 103); and the Gerald Desmond Bridge (part of Ocean Boulevard).

The arterial street network that serves the proposed Project area includes Seaside Avenue/Ocean Boulevard, Anaheim Street, Alameda Street, Henry Ford Avenue, New Dock Street, and Terminal Way. The local street network that provides access to Pier 400 includes Seaside Avenue/Ocean Boulevard, Navy Way, Terminal Way, and Reeves Avenue (see Figure 3.6-1).

The relationship of the proposed Project sites to the regional transportation network is shown in Figure 3.6-1. The regional, arterial and local access routes are described below:

Long Beach Freeway (I-710) and Harbor Freeway (I-110) are north-south highways that extend from the port area to downtown Los Angeles. They each have six lanes in the vicinity of the harbor and widen to eight lanes to the north of the harbor.
Figure 3.6-1. Local Circulation Network
Terminal Island Freeway (SR 47/SR 103) is a north-south highway grade separated from Ocean Boulevard that extends from Terminal Island across the Commodore Schuyler F. Heim Bridge and terminates at Willow Street approximately 245 m (800 ft) east of the Southern Pacific Intermodal Container Transfer Facility (ICTF). It is six lanes wide on the southern segment, narrowing to four lanes at Anaheim Street.

Pacific Coast Highway (Route 1) is a four lane, east-west highway that runs through Wilmington and Long Beach. Pacific Coast Highway (PCH) has interchanges with the Terminal Island Freeway, the Long Beach Freeway, and the Harbor Freeway.

Seaside Avenue/Ocean Boulevard runs east-west from downtown Long Beach, over the Gerald Desmond Bridge and includes a grade separated over-crossing to the terminus of the Terminal Island Freeway (SR 47/SR 103). Ocean Boulevard is designated as SR 47 between I-710 and SR 47. Ocean Boulevard/Seaside Avenue is designated SR 47 between I-110 and the Terminal Island Freeway. Ocean Boulevard has six lanes and left-turn lanes at intersections. Seaside Avenue is renamed Ocean Boulevard in Long Beach and continues to the east to the Gerald Desmond Bridge. Seaside Avenue/Ocean Boulevard is the primary access route to Terminal Island from the City of Los Angeles and San Pedro. Since the completion of the interchange at SR 47/SR 103, the only signalized intersection along Seaside Avenue/Ocean Boulevard is at Navy Way.

Anaheim Street is a four lane, east-west street that runs through Wilmington and Long Beach. Anaheim Street has interchanges with the Long Beach Freeway and the Harbor Freeway. It is designated as a no-truck route in Wilmington.

Alameda Street is a north-south street that runs parallel to the Union Pacific railroad tracks connecting the Port to downtown Los Angeles and several rail yards. Alameda Street has roadway width to provide for three lanes between Henry Ford Avenue and the Riverside Freeway (SR 91), although it is striped for two lanes each way over most of its length. Alameda Street turns into Harry Bridges Boulevard near the Union Pacific Railroad tracks in Wilmington. Most of the intersections along Alameda Street are now grade separated.

Henry Ford Avenue is a two lane street that connects New Dock Street with Ocean Boulevard on Terminal Island. North of Terminal Island, Henry Ford Avenue is a three lane street that connects the Terminal Island Freeway with Alameda Street.

New Dock Street is a two lane, east-west street that connects Terminal Island and the Terminal Island Freeway. New Dock Street has interchanges (southbound off and northbound on-ramps) with the Terminal Island Freeway.

Terminal Way is a four to six lane, generally east-west street providing access to Pier 300 and the U.S. Coast Guard Base. It turns into Ferry Street on its west end and Navy Way on its east end at Reeves Avenue.

Navy Way and Ferry Street are internal Port roadways that provide local access to Pier 300 and Pier 400 from Seaside Avenue/Ocean Boulevard and the Terminal Island Freeway (SR 47/SR 103). Navy Way connects Terminal Island to Pier 400.
There are no pedestrian access or public transit routes located within the proposed Marine Terminal area, Tank Farm Site 1 or Tank Farm Site 2, or along proposed pipeline rights-of-way.

The transportation environmental setting for the proposed Project includes those streets and intersections that would be used by both automobile and truck operations traffic to gain access to and from the Marine Terminal and Tank Farm Site 1, Tank Farm Site 2, and pipelines, as well as those streets that would be used by construction traffic (i.e., equipment and commuting workers). The streets most likely to be impacted by Project-related auto and truck traffic for daily operations or daily construction activity include the following: Seaside Avenue/Ocean Boulevard, Navy Way, Anaheim Street, Ferry Street, Alameda Street, and Henry Ford Avenue. The proposed Project would also generate auto and truck traffic on certain regional highways, including I-110, I-710, and SR 47. The four study intersections include the following (see Figure 3.6-1 for illustration of study intersection locations):

- Navy Way/Seaside Avenue
- Henry Ford Avenue/Anaheim Street
- Alameda Street/Anaheim Street
- Ferry Street/SR-47 Eastbound (EB) On/Off Ramps

All other project traffic would utilize the freeway system or where they pass-through intersections, the number of project trips would be nominal (less than five) and thus would not warrant analysis.

**Rail Systems**

The Terminal Island Container Transfer Facility (TICTF) provides rail connections to existing container terminals on Terminal Island. The TICTF consists of 4 intermodal facilities that directly transfer marine cargo containers to on-dock rail yards at the Global Gateway South, Evergreen, Yusen, and APM Terminals (APM) container terminals. The APM on-dock railyard, located on the eastern portion of Pier 400, encompasses 40 ac (16 ha) and consists of a loading yard and 12 tracks (i.e., working and storage tracks).

**3.6.2.2 Existing Area Traffic Conditions**

Navy Way on Pier 400 is currently utilized by traffic associated with APM Container Terminal operations. Trucks arriving at the APM Terminal typically access I-110 or I-710 en route to Pier 400. Most truck traffic arriving from destinations outside the Port proceed eastbound from I-110 to SR 47 across the Vincent Thomas Bridge or westbound from I-710 to Ocean Boulevard across the Gerald Desmond Bridge, and proceed along Seaside Avenue/Ocean Boulevard to Pier 400 via Navy Way. No other terminals are presently located on Pier 400, and the only regular use of Navy Way on Pier 400 at this time is that related to APM terminal operations.
3.6 Ground Transportation and Circulation

Roadway Operations

Truck and automobile traffic along roadways, including automobiles, Port trucks (i.e., containers, bobtails, and chassis), and other regional traffic not related to Port operations, affect traffic volumes within the proposed Project vicinity. Freeway ramp/roadway intersections along I-110, SR-47, and Route 1 south of the I-405 are also affected by regional traffic volumes. Existing average daily traffic (ADT) volumes for the key roadways in the proposed Project area are summarized in Table 3.6-1.

*Note:* The Port of Los Angeles Baseline Transportation Study (MMA 2004), developed in conjunction with the PCAC traffic subcommittee, evaluated only roadway segments with over 50 peak hour Port truck trips. As the Anaheim Street/Henry Ford Avenue and Navy Way/Seaside Avenue roadway intersections had less than 50 peak hour Port truck trips, these roadways were not evaluated in the Port of Los Angeles Baseline Transportation Study.

Intersection Operations

In Los Angeles, the Los Angeles Department of Transportation (LADOT) has adopted the use of the Critical Movement Analysis (CMA) method, as published in “Los Angeles Department of Transportation Traffic Study Policies and Procedures,” (August 2003). The CMA value is used to assess the intersections level of service. Level of Service (LOS) is a qualitative indication of an intersection's operating conditions as represented by traffic congestion and delay and the volume/capacity (V/C) ratio. For signalized intersections, it is measured from LOS A (excellent conditions) to LOS F (very poor conditions), with LOS D (V/C of 0.90, fair conditions) typically considered to be the threshold of acceptability. The relationship between V/C ratio and LOS for signalized intersections is shown in Table 3.6-2.

For signalized intersections, the LOS values were determined by using CMA methodology contained in the Transportation Research Board’s (TRB) Circular No. 212 – Interim Materials on Highway Capacity (TRB 1980). In addition, trucks use more roadway capacity than automobiles because of their size weight and acceleration capabilities compared to autos. The concept of Passenger Car Equivalent (PCE) is used in the study to adjust for the effect of trucks in the traffic stream. PCE is defined as the amount of capacity in terms of passenger cars used by...

Based on peak-hour traffic volumes, V/C ratios, and average intersection control delays, the corresponding LOS, as it existed in 2004, has been determined for each proposed Project area intersection. The resulting 2004 intersections LOS are summarized in Table 3.6-3. The data in the table indicate that the existing study intersections currently operate at LOS C or better during the morning and afternoon peak hours.

### 3.6.2.3 Existing Transit Service

Two transit agencies provide service around the proposed Project site in the Wilmington/San Pedro area, the Metropolitan Transportation Authority (MTA) and the Municipal Area Express (MAX). Together, the two transit agencies operate four transit routes within and/or near the proposed Project as follows:

- **MTA Transit Line 445 (San Pedro-Artesia Transit Center-Patsaouras Transit Plaza/Union Station Express).** MTA Transit Line 445 provides express bus service from Downtown Los Angeles to San Pedro via Harbor Freeway. Line 445 starts at Patsaouras Transit Plaza/Union Station in Downtown Los Angeles and travels south to its final destination in San Pedro at Pacific and 21st Street. Days of operation are Monday through Sunday, including all major holidays. The AM and PM peak period headway ranges between 30-51 minutes and 39-50 minutes, respectively. Saturday mid-day peak period is 1 hour.

- **MTA Transit Line 446 (San Pedro-Pacific Avenue-Wilmington-Carson-Patsaouras Transit Plaza/Union Station Express).** MTA Transit Line 446 provides express bus service from Downtown Los Angeles to San Pedro via Harbor Freeway, Avalon Boulevard, and Pacific Avenue. Line 446 starts at Patsaouras Transit Plaza in Downtown Los Angeles and travels south to its final destination at the Korean Bell Site. Days of operation are Monday through Sunday, including all major holidays. AM and PM peak period headway is approximately 1 hour and between 1 hour and 1 hour and 15 minutes, respectively. Saturday mid-day peak period headway is 1 hour.

- **MTA Transit Line 447 (San Pedro-7th Street-Wilmington-Carson-Patsaouras Transit Plaza/Union Station Express).** MTA Transit Line 447 provides express bus service from Downtown Los Angeles to San Pedro via Harbor Freeway, Harbor Boulevard, and 7th Street. Line 447 starts at Patsaouras Transit Plaza in Downtown Los Angeles and travels south to its final destination at 7th Street and Patton Avenue. Days of operation are Monday through Sunday, including all major holidays. AM and PM peak period headway is approximately 1 hour and between 1 hour and 1 hour and 15 minutes, respectively. Saturday mid-day peak period headway is 1 hour.

- **Municipal Area Express MX 3X (San Pedro-El Segundo Freeway Express).** MX 3X is a commuter bus service designed to address the commuting needs of South Bay residents who work in the El Segundo employment district. Line 3X is a special freeway express route that operates directly from San Pedro to El Segundo, starting at Pacific Crest near the USAF housing and ending at South La Cienega Boulevard near the Airport Courthouse. Days of operation are Monday through Friday only, excluding major holidays. AM/PM peak period does not apply because there is only one bus.

### 3.6.3 Applicable Regulations

Regulations, analysis methodologies, and transportation/circulation policies used to analyze proposed Project impacts were taken from the following agencies and their applicable documents:
3.6 Ground Transportation and Circulation

- Los Angeles County Metropolitan Transportation Authority (LACMTA), Congestion Management Program for Los Angeles County (adopted June 2002).

Because the roadways cross separate city and county jurisdictions, maintenance is undertaken by the appropriate city or county departments, and state roadways are maintained by the California Department of Transportation (Caltrans). In the study area, Caltrans has the primary responsibility for I-110, I-710, and SR-47; the Cities of Los Angeles and Long Beach (including the Ports of Los Angeles and Long Beach) have the primary responsibilities for the various roadways that make-up the local roadway network.

3.6.4 Impacts and Mitigation Measures

3.6.4.1 Methodology

Impacts were assessed by quantifying differences between future conditions without and with the proposed Project. Future traffic conditions were estimated by adding traffic due to proposed local development projects, regional traffic growth, and traffic increases resulting from San Pedro Bay Ports terminal throughput growth and separately for both project operations and project construction traffic to the baseline year 2004 traffic volumes. Appendix N provides detailed modeling results from the analysis.

The purpose of this analysis is to isolate and disclose information about the potential impacts of the proposed Project. Substantial growth in background traffic in the proposed Project vicinity has occurred since the CEQA Baseline year (2004) and is anticipated to occur in future analysis years. The average growth rate was estimated using the Existing 2003 PCE and 2015 Alternative 1 (No Project) PCE turning movement volumes from the TRAPAC Transportation and Circulation Study for the study area intersections (LAHD 2007). A straight line growth rate was derived using the 2003 and 2015 intersection turning movement volumes. The resulting growth rate was an average of 3.73 percent per year. For purposes of a worst case analysis, this study used an average growth rate of four percent per year. However, none of this growth as background traffic is attributable to the proposed Project. The TRAPAC traffic projections are the most recently completed projections that are part of an approved EIR in the Port, thus they are the most appropriate projections to tier off for current studies. This also ensures consistency with recently adopted environmental studies in the Port.

3.6.4.1.1 CEQA Baseline

Section 15125 of the CEQA Guidelines requires EIRs to include a description of the physical environmental conditions in the vicinity of a project that exist at the time of the NOP. These environmental conditions would normally constitute the baseline physical conditions by which the CEQA lead agency determines whether an impact is significant. However, a lead agency has discretion not to use an environmental
baseline set as of the time of the NOP for analysis of traffic impacts where the
agency determines, on the basis of substantial evidence, that future traffic impacts
surrounding the proposed Project will change regardless of whether the proposed
Project is approved. (See Napa Citizens v. Napa County Board of Supervisors [2001]

Because the Port anticipates that local traffic conditions surrounding the proposed
Project will increase regardless of whether the proposed Project is approved, CEQA
Baseline conditions for this traffic analysis include other anticipated future traffic
growth not attributable to the proposed Project (i.e., traffic in a given year due to
other proposed local development projects, regional traffic growth, and traffic
increases from Port terminal throughput growth not including the proposed Project.)

For this traffic analysis, the CEQA baseline for determining the significance of
potential Project impacts is Year 2004 baseline traffic conditions plus anticipated
growth in non-Project “background” traffic in Year 2010. Year 2010 is selected
because it is expected that Project construction will produce much higher trip levels
than Project operations, and Year 2010 is the year when Project construction – and
therefore Project-related traffic -- will reach its peak. After Year 2010, Project
construction traffic will diminish to zero, and relatively low Project operations traffic
will begin.

The CEQA Baseline differs from the No Federal Action/No Project Alternative
(discussed in Section 2.5.2.1) in that the No Federal Action/No Project Alternative
addresses what is likely to happen at the site over time, starting from the baseline
conditions. The No Federal Action/No Project Alternative allows for growth at the
proposed Project site that would occur without any required additional approvals.

The methodology of comparing Project traffic in 2010 to anticipated background
traffic levels (without the Project) in 2010 accounts for the impacts of the proposed
Project itself, compared to unrelated regional traffic growth, proposed local
development projects, and traffic increases resulting from Port terminal throughput
growth that is not attributable to the proposed Project. This method ensures that the
growth of background traffic in future years is not inaccurately attributed to the
Project. Although the CEQA Baseline used in this chapter differs from other impact
sections in which the CEQA Baseline is treated like a snapshot in time, it is utilized
because it provides a realistic and conservative identification and determination of
the likely traffic impacts.

3.6.4.1.2 NEPA Baseline

For purposes of this Draft SEIS/SEIR, the evaluation of significance under NEPA is
defined by comparing the proposed Project or other alternative to the No Federal
Action scenario (i.e., the NEPA Baseline and No Federal Action Alternative are
equivalent for this project). Unlike the CEQA Baseline, which is defined by
conditions at a point in time, the NEPA Baseline/No Federal Action is not bound by
statute to a “flat” or “no growth” scenario; therefore, the United States Army Corps
of Engineers (USACE) may project increases in operations over the life of a project
to properly analyze the NEPA Baseline/No Federal Action condition.
The NEPA Baseline condition for determining significance of impacts is defined by examining the full range of construction and operational activities that are likely to occur without a permit from the USACE. As documented in Section 2.6.1, the USACE, the LAHD, and the applicant have concluded that no part of the proposed Project would be built absent a USACE permit. Thus, for the case of this project, the NEPA Baseline is identical to the No Federal Action/No Project Alternative (see Section 2.6.1). Elements of the NEPA Baseline include:

- Paving, lighting, fencing, and construction of an access road at Tank Farm Site 1 to allow intermittent temporary storage of chassis-mounted containers on the site by APM;
- Paving, fencing, and lighting at Tank Farm Site 2 to allow intermittent temporary wheeled container storage by APL or Evergreen; and
- Additional crude oil deliveries at existing crude oil terminals in the San Pedro Bay Ports.

Significance of the proposed Project or alternative is defined by comparing the proposed Project or alternative to the NEPA Baseline (i.e., the increment). The NEPA Baseline conditions are described in Section 2.6.1 and 2.5.2.1.

For this traffic analysis, the NEPA Baseline is Year 2004 baseline traffic conditions plus anticipated growth in “background” traffic in Year 2010 under the No Federal Action scenario. Background traffic has been derived by adjusting the year 2004 baseline volumes by 4 percent per year to the year 2010 for a total increase of 24 percent. Project related traffic was then added to these derived volumes to forecast year 2010-plus-project conditions.

Note that the use of rounding up the adjustment for anticipated growth in background traffic (i.e., rounding the 3.73 percent factor from LAHD (2007) to 4 percent) provides for a conservative or worst-case analysis because the significance of impacts depends on the overall final LOS (i.e., background levels plus the proposed Project).

### 3.6.4.2 Thresholds of Significance

The L.A. CEQA Thresholds Guide (City of Los Angeles 2006) provides specific guidance to address potential traffic impacts resulting from construction and operation of a proposed project. A project in the Los Angeles Harbor is considered to have a significant transportation/circulation impact if the project or action would result in one or more of the following occurrences discussed below.

The proposed Project would have a significant impact on transportation/circulation if it would:

**TRANS-1:** Result in short-terms impacts on streets during proposed Project construction. In the absence of specific criteria for construction impacts from LADOT, the same significant impact thresholds for intersections during operations are also applied for the construction period. Thus, a project would have a significant impact under CEQA or an adverse impact under NEPA on transportation/circulation during construction if it would increase an intersection’s V/C ratio in accordance with the
following guidelines: (Note that the impact would be less than significant if the final LOS is A or B.)

- V/C ratio increase greater than or equal to 0.040 if final LOS is C,
- V/C ratio increase greater than or equal to 0.020 if final LOS is D, or
- V/C ratio increase greater than or equal to 0.010 if final LOS is E or F.

**TRANS-2:** Increase an intersection’s volume/capacity ratio in accordance with the following guidelines: (Note that the impact would be less than significant if the final LOS is A or B.)

- V/C ratio increase greater than or equal to 0.040 (or 4 seconds delay for stop-controlled intersections) if final LOS is C,
- V/C ratio increase greater than or equal to 0.020 (or 2 seconds delay for stop-controlled intersections) if final LOS is D, or
- V/C ratio increase greater than or equal to 0.010 (or 1.5 seconds delay for stop-controlled intersections) if final LOS is E or F.
- If an unsignalized intersection is projected to operate at LOS C, D, E or F, the intersection would be re-analyzed using the signalized intersection methodology to determine the significance of impacts using the sliding scale criteria described above per the *L.A. CEQA Thresholds Guide*.

**TRANS-3:** Additional demand on local transit services may occur due to project operation. However, LADOT does not have any established thresholds to determine significance of transit system impacts. The project would have an impact on local transit services if it would increase demand beyond the supply of such services anticipated at Project Build-out.

**TRANS-4:** According to the Congestion Management Plan (CMP), Traffic Impact Analysis Guidelines, an increase of 0.02 or more in the demand-to-capacity (D/C) ratio with a resulting LOS F at a CMP arterial monitoring station is deemed a significant impact. This applies only if the project meets the minimum CMP threshold for analysis, which is 50 trips at a CMP intersection and 150 trips on a freeway segment.

**TRANS-5:** An increase in rail activity could cause delays to motorists at the affected at-grade crossings where additional project trains would cross and/or where the project would result in additional vehicular traffic flow. The project is considered to have a significant impact at the affected at-grade crossings if the average vehicle control delay caused by the project at the crossing would exceed the Highway Capacity Manual (HCM) threshold for level of service E at a signalized intersection, which is 55 seconds of average vehicle delay (TRB 2000). The Highway Capacity Manual is the national standard for the measurement of highway and intersection capacity and levels of service.
3.6.4.3 Project Impacts and Mitigation

3.6.4.3.1 Proposed Project

3.6.4.3.1.1 Construction Impacts

Impact TRANS-1: Proposed Project construction would result in a short-term, temporary increase in auto traffic.

Proposed construction activities include constructing a Marine Terminal and ancillary infrastructure, tank farms, and pipelines. The proposed construction schedule for the Marine Terminal, tank farm sites, pipelines, and all ancillary components would be up to 30 months. During construction, there would be temporary impacts to the surrounding street network as a result of worker and truck trips traveling to and from the proposed Project sites, as well as temporary road and/or lane closures. The total number of construction-related trips would vary during the construction of the proposed Project. It is anticipated that the majority of construction materials (i.e., aggregate, concrete, asphalt, sand, and slurry) would be provided by local suppliers and stored at the contractors’ existing facilities. The majority of construction materials would be imported during off-peak traffic hours (the main exception being cement trucks, which have a limited window for delivery times). Construction haul routes would be via the I-110 to SR 47 across the Vincent Thomas Bridge or via the I-710 to Ocean Boulevard across the Gerald Desmond Bridge to Navy Way via Seaside Avenue/Ocean Boulevard.

During the pipeline construction period (up to 16 months), the proposed Project would temporarily increase traffic hazards by closing lanes to accommodate proposed jack and bore crossings under streets and railroads within the Port; no crossings would occur within the City of Los Angeles. Construction of the Marine Terminal and Tank Farm Sites 1 and 2 would not require any street and/or rail crossings. Except for segments of Pipeline Segment 4 near the Ultramar/Valero Refinery, all construction activities would occur within the Port boundaries (except some HDD that would not affect conditions on the ground). Potential construction staging/storage areas are shown on Figure 2-12 and Table 2-8.

Construction Worker Trips

Construction staging and Temporary Construction Yard (TCY) sites have been identified with approximately 523 construction workers distributed to these sites during the peak construction period (which would occur in year 2010). This peak number would occur for a very brief time (one week to one month) if at all; however, the analysis is based on this peak number in order to provide for a conservative analysis scenario.

Table 3.6-4 provides a summary of distribution of construction workers over the various construction sites.
### Table 3.6-4. Distribution of Construction Workers for Proposed Project

<table>
<thead>
<tr>
<th>Construction Site</th>
<th>Peak Workers</th>
<th>Trip Distribution</th>
</tr>
</thead>
</table>
| Marine Terminal   | 90           | 50% (peak = 45) to Berth 408  
|                   |              | 50% (peak = 45) to TCY 417, then bussed to Berth 408 |
| Tank Farm Site 1 and Pipeline Segment 1 | 151 | 80% (peak = 121) to TCY 417, then bussed to sites  
|                   |              | 20% (peak = 30) to individual sites |
| Tank Farm Site 2 and Pipeline Segments 2a, 2b, 2c | 192 | 80% (peak = 154) to TCY 408, then bussed to sites  
|                   |              | 20% (peak = 38) to individual sites |
| Pipeline Segments 3, 4, 5 | 90 | 80% (peak = 72) to TCY 425, then bussed to sites  
|                   |              | 20% (peak = 18) to individual sites |

*Note: The peak number of workers at each site would occur for a relatively brief time. Current construction plans do not indicate overlap of the peak workers at the various sites at the same time. Although analysis is based on all sites being at peak construction at the same time to provide for a conservative analysis, the amount of time this would occur would be brief (e.g., less than one month), if it occurred at all.*

Construction activities would occur 6 days a week, 10 hours a day from 7:00 AM to 5:00 PM on weekdays and 8:00 AM to 6:00 PM on Saturday. Although approximately 1,046 worker trips (i.e., 523 times 2) would occur during the peak construction period, due to the modified work hours, construction worker trips are not expected to impact the surrounding street network during the AM peak period from 7:00 AM to 9:00 AM.

Workers would arrive at the construction site prior to the AM peak period (shift starts at 7:00 AM) and would not impact the AM peak hour. However, construction workers depart during the PM peak period (shift ends at 5:00 PM) and could potentially impact the PM peak hour commute.

### Truck Trips

For most of the construction period, construction activities would require approximately 25 truck trips per day on average to import construction equipment and materials for the various construction sites. During installation of stone columns at Tank Farm Site 2, an additional 55 truck trips per day on average would be required to deliver stone from TCY 427 (or, if the preferred site at TCY 427 is not available, TCY 412) to Tank Farm Site 2. During installation of stone columns at Tank Farm Site 1, an additional The majority of construction materials would be imported during off-peak traffic hours (i.e., between 9:00 AM and 4:00 PM or between 6:00 PM and 7:00 AM, or on Saturdays). The main exception would be cement trucks, which have a limited window for delivery times.

Note that the modified hours for truck deliveries would not result in construction occurring near residential areas outside of the hours dictated by the City of Los Angeles noise ordinance. This noise ordinance limits construction near residences to 7:00 AM to 9:00 PM, Monday through Friday, and from 8:00 AM to 6:00 PM on Saturday.
Construction Period Traffic Handling Assumptions

The following standard construction period traffic handling measures would be used and, therefore, are assumed for the analysis:

- **Designated Truck Routes:** Trucks delivering materials to and from the construction site must stay on designated truck routes determined by Caltrans and the City of Los Angeles Department of Transportation. Preapproved truck routes around the Port include:
  - Interstate 110 – Beginning at Junction 9th Street and Gaffey Street and ending at Junction Route 47
  - Interstate 110 – Beginning at Junction Route 47 and ending at Junction Route 101
  - State Highway 47 – Beginning at Junction 110 and ending at Junction Route 103
  - Interstate 710 – Beginning at Route 1 and ending at Junction 10
  - State Highway 103 – Beginning at Junction Route 47 and ending at Junction Route 1 (Pacific Coast Highway)

- **Traffic Control:** In the event that a temporary road and/or lane closure would be necessary during construction, the contractor shall provide traffic control activities and personnel, as necessary and as required by LADOT, to minimize traffic impacts. This may include detour signage, cones, construction area signage, flagmen, and other measures as required for safe traffic handling in the construction zone.

- **Construction Scheduling:** Construction would not occur near residential areas outside of the hours dictated by the City of Los Angeles noise ordinance. The City of Los Angeles noise ordinance limits construction near residences to 7:00 AM to 9:00 PM, Monday through Friday, and from 8:00 AM to 6:00 PM on Saturday.

Approved emergency equipment access standards would be incorporated into proposed Project construction plans, ensuring provisions for adequate roadway width, turning radii, and staging areas. Additionally, it is expected that any proposed lane closures would be modified as the design team refines the construction plans and traffic strategies, pipeline construction.

Furthermore, the proposed Project would be subject to conditions of approval due to mitigation measures identified in the Deep Draft FEIS/FEIR to reduce impacts on ground transportation. These conditions of approval include the following:

- The contractor shall encourage construction workers to carpool by offering various incentives.
- When possible, trucks that are utilized to bring equipment and materials to the site shall be used to carry off any debris, excess materials, etc.
- Tenants shall be encouraged to reduce the number of vehicle trips associated with employee vehicles by introducing ridesharing incentives, parking management programs (i.e., parking spaces to ride sharers and removing street...
parking), auto use restriction program, and truck movement restriction program.

- On-site information on the importance of the reduction in vehicle miles traveled and related air quality impacts shall be provided and literature on rideshare programs shall be dispensed.

**CEQA Impact Determination**

As shown in Table 3.6-5, there would be a significant impact from construction activities under CEQA at one intersection, Navy Way/Seaside Avenue during the PM peak hour. The final LOS would be C, and proposed Project construction trips would increase V/C by 0.062, greater than the 0.04 threshold used for Impact TRANS-1 as described above (Section 3.6.4.2). Thus, proposed Project construction traffic would result in a significant temporary construction impact on ground transportation and circulation at this intersection.

Because proposed Project construction would generate relatively small numbers of daily truck trips to begin with, and most materials (with the exception of cement) would be brought in during off-peak hours, project construction truck trips during the AM and PM peak periods are not expected to create any other significant impacts on the roadway system from proposed Project.

**Mitigation Measures**

MMs 4F-1, 4F-2, 4F-4, and 4F-5 from the 1992 Deep Draft FEIS/FEIR would apply, as noted in Section 3.6.1.1. In addition, standard traffic control measures associated with any temporary road/lane closures would apply, including detour signage, cones, construction area signage, and flagmen. MM TRANS-1 would also be required to reduce significant impacts on the Ferry Street/SR-47 EB on/off-ramps.

**MM TRANS-1: Outbound Construction Worker Routing.** Outbound westbound construction workers from TCY 421 and TCY 408 would be directed to leave these yards by traveling northbound on Ferry Street, then access SR-47 westbound via the Ferry Street/SR-47 ramp interchange. Outbound eastbound construction workers would be directed to leave TCY 421 and TCY 408 by traveling southbound on Ferry Street, following Ferry Street as it turns into Terminal Way heading northeast, turn left on Navy Way, and then turn right at the Navy Way/Seaside Avenue intersection.

**Residual Impacts**

As shown in Table 3.6-7, after application of MM TRANS-1, construction period impacts at Navy Way/Seaside Avenue would be less than significant. The final LOS would still be C, but the increase due to proposed Project construction trips would be smaller than the 0.04 threshold used for Impact TRANS-1 as described above (Section 3.6.4.2). Residual impacts would be less than significant.

**NEPA Impact Determination**

As shown in Table 3.6-6, there would be a significant impact from construction activities under NEPA at one intersection, Navy Way/Seaside Avenue during the

PM peak hour, due to construction auto traffic. The final LOS would be C, and proposed Project construction trips would increase V/C by 0.062, greater than the 0.04 threshold used for Impact TRANS-1 as described above (Section 3.6.4.2). Thus, proposed Project construction traffic would result in a significant temporary construction impact on ground transportation and circulation at this intersection.

Because proposed Project construction would generate relatively small numbers of daily truck trips to begin with, and most materials (with the exception of cement) would be brought in during off-peak hours, project construction truck trips during the AM and PM peak periods are not expected to create any other significant impacts on the roadway system from the proposed Project.

**Mitigation Measures**

MMs 4F-1, 4F-2, 4F-4, and 4F-5 from the 1992 Deep Draft FEIS/FEIR would apply, as noted in Section 3.6.1.1. In addition, standard traffic control measures associated with any temporary road/lane closures would apply, including detour signage, cones, construction area signage, and flagmen. MM TRANS-1 would also be required to reduce significant impacts on the Ferry Street/SR-47 EB on/off-ramps.

**MM TRANS-1: Outbound Construction Worker Routing.** Outbound westbound construction workers from TCY 421 and TCY 408 would be directed to leave these yards by traveling northbound on Ferry Street, then access SR-47 westbound via the Ferry Street/SR-47 ramp interchange. Outbound eastbound construction workers would be directed to leave TCY 421 and TCY 408 by traveling southbound on Ferry Street, following Ferry Street as it turns into Terminal Way heading northeast, turn left on Navy Way, and then turn right at the Navy Way/Seaside Avenue intersection.

**Residual Impacts**

As shown in Table 3.6-8, after application of MM TRANS-1, construction period impacts at Navy Way/Seaside Avenue would be less than significant. The final LOS would still be C, but the increase due to proposed Project construction trips would be smaller than the 0.04 threshold used for Impact TRANS-1 as described above (Section 3.6.4.2). Residual impacts would be less than significant.

**3.6.4.3.1.2 Operational Impacts**

**Impact TRANS-2:** Long-term vehicular traffic associated with the proposed Project would not substantially affect volume/capacity ratios or levels of service on regional intersections.

The only vehicular trips accessing the proposed Project sites on a regular basis during proposed Project operation would be those of the Marine Terminal and tank farm employees, personnel manning the security gates, and workers periodically checking the tanks and pipelines.

The Marine Terminal would be accessed via Navy Way to the Marine Terminal access road. The proposed Project would require a total of approximately 7 truck

2. No change since proposed Project construction would not affect AM peak hour trips per Section 3.6.4.3.1.1.
deliveries per week of supplies and materials to support operations of crew on board a vessel at the Berth 408. Proposed Marine Terminal operations would not require tanker trucks to accommodate throughput of crude oil at Berth 408. Deliveries would occur by vessel only and would be transported via pipeline from Pier 400 to the tank farm sites, refineries, and other Plains pipeline systems nearby.

The operation of the proposed Project would require up to 54 full-time equivalent personnel, including personnel at the Marine Terminal, tugboat and Port pilot crews, and inspection and maintenance teams (including some maintenance tasks that begin five to ten years after the startup of operations). However, many of these personnel would commute outside normal peak hours. For instance, of the 24 employees at the Marine Terminal and Tank Farm Site 1 area, only 13 are expected to end their shifts during the PM peak hour. Also, crews involved in pipeline and storage tank inspection and maintenance would be hired only on a periodic basis, and would frequently work on extended shifts to minimize the duration of shutdown of a pipeline segment or storage tank; as a result of working on extended shifts, these employees would typically arrive prior to the AM peak hour and leave after the PM peak hour. In addition, some of the employees would travel to work sites that do not require them to travel on Terminal Island and, therefore, would not contribute trips to the same intersections as those used by employees reporting to the Marine Terminal or Tank Farm Site 2. For example, several of the employees are expected to work at the Plains office located in the city of Long Beach, and the Port pilot crews would typically report to the Port Pilot station on the west side of the Main Channel. For the purposes of analyzing ground transportation impacts, proposed Project operations would result in a maximum increase of 80 employee vehicular trips per day (40 during the AM peak hour and a maximum of 40 during the PM peak hour). The addition of 40 PM peak hour operational trips is below the threshold of 43 PM peak hour trips required by LADOT to perform a traffic analysis of study area intersections for a proposed project (see LADOT Policies and Procedures – Revised August 2003) and, therefore, a detailed intersection analysis is not required. For purposes of analyzing project operations, the results of the addition of 40 peak hour trips is provided for year 2010 when project construction activity is ending and project operational activities are beginning.

**CEQA Impact Determination**

Traffic modeling results, summarized in Table 3.6-9, show that the one intersection impacted during construction activities (i.e., Navy Way/Seaside Avenue) would continue to operate at LOS B during the AM peak hour and LOS C during the PM peak hour, with an increase of only 0.008 in V/C due to proposed Project operations traffic, thus there is no projected significant impact associated with operational activities. Impacts on transportation would be less than significant.

**Mitigation Measures**

As long-term vehicular traffic would not significantly degrade local intersection LOS, no additional mitigation measures are required.

**Residual Impacts**

Residual impacts would be less than significant.

Note:
1. City of Los Angeles signalized intersections were analyzed using Critical Movement Analysis (CMA) methodology.
NEPA Impact Determination

Traffic modeling results, summarized in Table 3.6-10, show that the one intersection impacted by construction activities (i.e., Navy Way/Seaside Avenue) would continue to operate at LOS B during the AM peak hour and LOS C during the PM peak hour, with an increase of only 0.008 in V/C due to proposed Project operations traffic, thus there is no projected significant impact associated with operational activities. Impacts on transportation would be less than significant.

Mitigation Measures

As long-term vehicular traffic would not significantly degrade local intersection LOS, no additional mitigation measures are required.

Residual Impacts

Residual impacts would be less than significant.

Impact TRANS-3: Proposed Project operations would not result in a significant increase in related public transit use.

Although the proposed Project would result in additional on-site employees, the increase in work-related trips using public transit would be negligible. Port terminals generate extremely low transit demand for several reasons. The primary reason that Port workers do not use public transit is that many terminal workers must first report to union halls for dispatch before proceeding to the terminal to which they have been assigned. Most workers prefer to use a personal automobile to facilitate this disjointed travel pattern. Also, Port workers live throughout the southern California region and do not have access to the few bus routes that serve the Port. Additionally, Port workers’ incomes are generally higher than similarly skilled jobs in other areas and higher incomes correlates to lower transit usage. Finally, parking at the Port is readily available and free, which encourages workers to drive to work. Therefore, it is expected that less than five work trips would be made on public transit, which could easily be accommodated by existing bus transit services and would not result in a demand for transit services which would exceed the supply of such services. Observations of transit usage in the area for bus routes that serve the project area (MTA routes 446 and 447) revealed that the buses are currently not operating near capacity and would be able to accommodate this level of increase in demand without exceeding supply.

CEQA Impact Determination

Impacts due to additional demand on local transit services would be less than significant under CEQA.

Mitigation Measures

No mitigation required.

3.6 Ground Transportation and Circulation

Residual Impacts

Less than significant impacts.

NEPA Impact Determination

Impacts due to additional demand on local transit services would be less than significant under NEPA.

Mitigation Measures

No mitigation required.

Residual Impacts

Less than significant impacts.

Impact TRANS-4: Proposed Project operations would not result in a significant increase in freeway congestion.

According to the CMP, Traffic Impact Analysis (TIA) Guidelines, a traffic impact analysis is required at the following:

- CMP arterial monitoring intersections, including freeway on-ramp or off-ramp, where the Project or its alternatives would add 50 or more trips during either the AM or PM weekday peak hours.
- CMP freeway monitoring locations where the Project or its alternatives would add 150 or more trips during either the AM or PM weekday peak hours.

Per CMP guidelines, an increase of 0.02 or more in the demand-to-capacity (D/C) ratio with a resulting LOS F is deemed a significant impact.

The closest CMP arterial monitoring station to the proposed Project is Alameda Street/Pacific Coast Highway. The proposed Project (with a maximum of 40 AM peak hour inbound trips and 40 PM peak hour outbound trips, as documented above) would add less than 50 trips through this intersection, and, therefore, no CMP system analysis is required at this location.

The closest freeway monitoring station is located at I-110 at “C”-Street and I-710 at Willow Street. The results of the analysis indicate that the Project would not result in more than 150 additional Project trips (as the proposed Project would have a maximum of 40 AM peak hour inbound trips and 40 PM peak hour outbound trips) at either of the CMP freeway monitoring locations; therefore, no CMP system analysis is required at those locations.

CEQA Impact Determination

Traffic impacts would be less than significant under CEQA.
Mitigation Measures

No mitigation required.

Residual Impacts

Less than significant impacts.

NEPA Impact Determination

Traffic impacts would be less than significant under NEPA.

Mitigation Measures

No mitigation required.

Residual Impacts

Less than significant impacts.

Impact TRANS-5: Proposed Project operations would not cause an increase in rail activity that would cause delays in regional traffic.

Rail activity causes delay at crossings where the trains pass and cause auto and truck traffic to stop. The amount of delay is related to the length of the train, the speed of the train and the amount of auto and truck traffic that is blocked.

The proposed Project would not cause an increase in rail traffic. All product would be transported by pipeline.

CEQA Impact Determination

No impact.

Mitigation Measures

No mitigation required.

Residual Impacts

No impact.

NEPA Impact Determination

No impact.

Mitigation Measures

No mitigation required.
3.6 Ground Transportation and Circulation

Residual Impacts

No impact.

3.6.4.3.2 No Federal Action/No Project Alternative

Under the No Federal Action/No Project Alternative, proposed Project facilities would not be constructed or operated. As described in Section 2.5.2.1, the No Federal Action/No Project Alternative considers the only remaining allowable and reasonably foreseeable use of the proposed Project site: Use of the site for temporary storage of wheeled containers on the site of Tank Farm 1 and on Tank Farm Site 2. This use would require paving, construction of access roads, and installation of lighting and perimeter fencing.

In addition, for analysis purposes, under the No Federal Action/No Project Alternative a portion of the increasing demand for crude oil imports is assumed to be accommodated at existing liquid bulk terminals in the San Pedro Bay Ports, to the extent of their remaining capacities. Although additional demand, in excess of the capacity of existing marine terminals to receive it, may come in by rail, barge, or other means, rather than speculate about the specific method by which more crude oil or refined products would enter southern California, for analysis purposes, the impact assessment for the No Federal Action/No Project Alternative in this SEIS/SEIR is based on marine deliveries only up to the available capacity of existing crude oil berths. As described in Section 2.5.2.1, the impact assessment for the No Federal Action/No Project Alternative also assumes existing terminals would eventually comply with the California State Lands Commission (CSLC) Marine Oil Terminal Engineering and Maintenance Standards (MOTEMS), that LAHD and the Port of Long Beach would renew the operating leases for existing marine terminals, and that existing terminals would comply with Clean Air Action Plan (CAAP) measures as of the time of lease renewal (i.e., 2008 for Port of Long Beach Berths 84-87, 2015 for LAHD Berths 238-240, and 2023 for Port of Long Beach Berths 76-78).

The NEPA Baseline condition coincides with the No Federal Action/No Project Alternative for this project because the USACE, the LAHD, and the applicant have concluded that, absent a USACE permit, no part of the proposed Project would be built (Section 2.6.1). All elements of the No Federal Action/No Project Alternative are identical to the elements of the NEPA Baseline. Therefore, under a NEPA determination there would be no impact associated with the No Federal Action/No Project Alternative.

3.6.4.3.2.1 Construction Impacts

Impact TRANS-1: Construction in the No Federal Action/No Project Alternative would not result in a short-term, temporary increase in truck or auto traffic.

CEQA Impact Determination

Construction of temporary storage area for wheeled containers on Tank Farm Sites 1 and 2 would result in a short-term and relatively small construction effort, estimated to occur over eight weeks and involve minimal truck and automobile traffic. The
LAHD and its contractors would schedule construction activities so as to avoid any peak-hour trips. Impacts would be less than significant.

Increased vessel deliveries at other crude oil terminals in the San Pedro Bay Ports would not result in construction; therefore, there would be no construction related impact at other terminals.

**Mitigation Measures**

No mitigation would be necessary.

**Residual Impacts**

Less than significant.

**NEPA Impact Determination**

Because the No Federal Action/No Project Alternative is identical to the NEPA Baseline in this project, under NEPA the No Federal Action/No Project Alternative would have no impact.

**Mitigation Measures**

No mitigation would be necessary.

**Residual Impacts**

No impacts.

**3.6.4.3.2.2 Operational Impacts**

**Impact TRANS-2:** Long-term vehicular traffic associated with the No Federal Action/No Project Alternative would not significantly impact the study intersection’s volume/capacity ratios, or level of service.

**CEQA Impact Determination**

Operation of the new temporary storage area for wheeled containers on Tank Farm Sites 1 and 2 would not result in increased throughput at any of the container terminals (APM, APL or Evergreen) (see Section 2.5.2.1), nor would it increase operational employment at that terminal. Increased vessel deliveries at other crude oil terminals in the San Pedro Bay Ports would not result in increased operational employees at those terminals; therefore, there would be no operation related impact at other terminals.

**Mitigation Measures**

No mitigation would be necessary.
Residual Impact

No impacts.

NEPA Impact Determination

Because the No Federal Action/No Project Alternative is identical to the NEPA Baseline in this project, under NEPA the No Federal Action/No Project Alternative would have no impact.

Mitigation Measures

No mitigation would be necessary.

Residual Impacts

No impacts.

Impact TRANS-3: An increase in on-site employees due to the No Federal Action/No Project Alternative operations would not result in an increase in related public transit use.

CEQA Impact Determination

Operation of the new temporary storage area for wheeled containers on Tank Farm Sites 1 and 2 would not result in increased throughput at any of the container terminals (APM, APL or Evergreen) (see Section 2.5.2.1), nor would it increase operational employment at those terminals. Increased vessel deliveries at other crude oil terminals in the San Pedro Bay Ports would not result in increased operational employees at those terminals; therefore, there would be no operation related impact at other terminals. Because operational employment would not increase, there would be no impact on public transit use.

Mitigation Measures

No mitigation would be necessary.

Residual Impacts

No impacts.

NEPA Impact Determination

Because the No Federal Action/No Project Alternative is identical to the NEPA Baseline in this project, under NEPA the No Federal Action/No Project Alternative would have no impact.

Mitigation Measures

No mitigation would be necessary.
Residual Impacts

No impacts.

Impact TRANS-4: No Federal Action/No Project Alternative operations could result in a significant increase in freeway congestion.

CEQA Impact Determination

Operation of the new temporary storage area for wheeled containers on Tank Farm Sites 1 and 2 would not result in increased throughput at any of the container terminals (APM, APL or Evergreen) (see Section 2.5.2.1), nor would it increase operational employment at that terminal. Increased vessel deliveries at other crude oil terminals in the San Pedro Bay Ports would not result in increased operational employees at those terminals; therefore, there would be no operation related impact at other terminals. Because neither throughput nor operational employment would increase, there would be no impact on freeway congestion related to the use of Tank Farm Sites 1 and 2 for temporary storage of wheeled containers.

While constrained marine import infrastructure could result in increased use of trucks to transport refined products to southern California, the amount of the increase and specific routes are speculative, and this possibility was not analyzed in detail. Since the locations and types of facilities to support alternative modes of transportation required to deliver crude oil to the Los Angeles area are unpredictable, the CEQA impacts related to Impact TRANS-4 cannot be determined.

Mitigation Measures

Although constrained marine import infrastructure could result in increased use of trucks to transport refined products to southern California, the amount of the increase and specific routes are speculative, and this possibility was not analyzed in detail. Thus, mitigation measures are also speculative.

Residual Impacts

Residual impacts cannot be determined.

NEPA Impact Determination

Because the No Federal Action/No Project Alternative is identical to the NEPA Baseline in this project, under NEPA the No Federal Action/No Project Alternative would have no impact.

Mitigation Measures

No mitigation would be necessary.

Residual Impacts

No impacts.
Impact TRANS-5: No Federal Action/No Project Alternative operations could cause an increase in rail activity, causing delays in regional traffic.

**CEQA Impact Determination**

Operation of the new temporary storage area for wheeled containers on Tank Farm Sites 1 and 2 would not result in increased throughput at any of the container terminals (APM, APL or Evergreen) (see Section 2.5.2.1); thus, the No Federal Action/No Project Alternative would not result in increased rail activity related to the use of Tank Farm Sites 1 and 2 for temporary storage of wheeled containers. Increased vessel deliveries at other crude oil terminals in the San Pedro Bay Ports also would not result in increased rail activity because additional product deliveries would be transported from the terminals by pipeline.

However, the constrained marine import infrastructure and ongoing increases in demand for crude oil importation could result in increased use of rail cars to transport crude oil or refined products to southern California. The amount of the increase and specific routes are speculative, and this possibility was not analyzed in detail. Since the locations and types of facilities to support alternative modes of transportation required to deliver crude oil to the Los Angeles area are unpredictable, the CEQA impacts related to Impact TRANS-5 cannot be determined.

**Mitigation Measures**

Although constrained marine import infrastructure could result in increased use of rail cars to transport crude oil or refined products to southern California, the amount of the increase and specific routes are speculative, and this possibility was not analyzed in detail. Thus, mitigation measures are also speculative.

**Residual Impacts**

Residual impacts cannot be determined.

**NEPA Impact Determination**

Because the No Federal Action/No Project Alternative is identical to the NEPA Baseline in this project, under NEPA the No Federal Action/No Project Alternative would have no impact.

**Mitigation Measures**

No mitigation would be necessary.

**Residual Impacts**

No impacts.
3.6.4.3.3 Reduced Project Alternative

Under the Reduced Project Alternative, as described in Section 2.5.2.2, construction and operation at Berth 408 would be identical to the proposed Project with the exception of the lease cap limiting throughput in certain years. However, as explained in Section 2.5.2.2, the lease cap would not change the amount of crude oil demanded in southern California, and therefore the analysis of the Reduced Project Alternative also includes the impacts of marine delivery of incremental crude oil deliveries to existing liquid bulk terminals in the San Pedro Bay Ports in years where demand exceeds the capacity of the lease-limited Berth 408.

As described in Section 2.5.2.2, the impact assessment for the Reduced Project Alternative also assumes existing terminals would eventually comply with the MOTEAMS, that the LAHD and the Port of Long Beach would renew the operating leases for existing marine terminals, and that existing terminals would comply with CAAP measures as of the time of lease renewal (i.e., 2008 for Port of Long Beach Berths 84-87, 2015 for LAHD Berths 238-240, and 2023 for Port of Long Beach Berths 76-78).

Since construction activities and operation phase employment would be identical for the proposed Project and the Reduced Project Alternative, ground transportation impacts are also identical.

3.6.4.3.3.1 Construction Impacts

Impact TRANS-1: Construction of the Reduced Project Alternative would result in a short-term, temporary increase in auto traffic.

Like the proposed Project, construction activities for the Reduced Project Alternative include constructing a Marine Terminal and ancillary infrastructure, tank farms, and pipelines. The construction schedule for the Marine Terminal, tank farm sites, pipelines, and all ancillary components would be up to 30 months. During construction, there would be temporary impacts to the surrounding street network as a result of worker and truck trips traveling to and from the Project sites, as well as temporary road and/or lane closures. The total number of construction-related trips would vary during the construction of the Reduced Project Alternative, but trips, staging, and distribution would be the same as for the proposed Project (Table 3.6-4). As with the proposed Project, it is anticipated that the majority of construction materials (i.e., aggregate, concrete, asphalt, sand, and slurry) would be provided by local suppliers and stored at the contractors’ existing facilities, and the majority of construction materials would be imported during off-peak traffic hours (the main exception being cement trucks, which have a limited window for delivery times). Construction haul routes would be identical to the proposed Project.

During the pipeline construction period (up to 16 months), the Reduced Project Alternative would temporarily increase traffic hazards by closing lanes to accommodate proposed jack and bore crossings under streets and railroads within the Port; no crossings would occur within the City of Los Angeles. Construction of the Marine Terminal and Tank Farm Sites 1 and 2 would not require any street and/or rail crossings. Except for segments of Pipeline Segment 4 near the Ultramar/Valero...
3.6 Ground Transportation and Circulation

Refinery, all construction activities would occur within the Port boundaries (except some HDD that would not affect conditions on the ground). Potential construction staging/storage areas are shown on Figure 2-12 and Table 2-8.

**Construction Worker Trips**

Construction staging and TCY sites have been identified with approximately 523 construction workers distributed to these sites during the peak construction period (which would occur in year 2010). This peak number would occur for a very brief time (one week to one month) if at all; however, the analysis is based on this peak number in order to provide for a conservative analysis scenario. Table 3.6-4 above provides a summary of distribution of construction workers over the various construction sites. Construction timing would be identical to the proposed Project.

**Truck Trips**

Construction activities would require approximately 25 truck trips per day on average to import construction equipment and materials for the various construction sites. The majority of construction materials would be imported during off-peak traffic hours (i.e., between 9:00 AM and 4:00 PM or between 6:00 PM and 7:00 AM, or on Saturdays). The main exception would be cement trucks, which have a limited window for delivery times.

Note that the modified hours for truck deliveries would not result in construction occurring near residential areas outside of the hours dictated by the City of Los Angeles noise ordinance. This noise ordinance limits construction near residences to 7:00 AM to 9:00 PM, Monday through Friday, and from 8:00 AM to 6:00 PM on Saturday.

**Construction Period Traffic Handling Assumptions**

The same standard construction period traffic handling measures, detailed above, would be used for the Reduced Project Alternative as for the proposed Project. The Reduced Project Alternative would be subject to conditions of approval due to mitigation measures identified in the Deep Draft FEIS/FEIR to reduce impacts on ground transportation. These conditions of approval are the same as those described in Section 3.6.4.3.1.1 for the proposed Project.

**CEQA Impact Determination**

As shown in Table 3.6-5, there would be a significant impact during project construction activities under NEPA at one intersection, Navy Way/Seaside Avenue during the PM peak hour, due to construction auto traffic. The final LOS would be C, and Reduced Project Alternative construction trips would increase V/C by 0.062, greater than the 0.04 threshold used for Impact TRANS-1 as described above (Section 3.6.4.2). Thus, construction traffic from the Reduced Project Alternative would result in a significant temporary construction impact on ground transportation and circulation at this intersection.

Because Reduced Project Alternative construction would generate relatively small numbers of daily truck trips to begin with, and most materials (with the exception of
cement) would be brought in during off-peak hours, construction truck trips during the AM and PM peak periods are not expected to create any other significant impacts on the roadway system.

**Mitigation Measures**

MMs 4F-1, 4F-2, 4F-4, and 4F-5 from the 1992 Deep Draft FEIS/FEIR would apply, as noted in Section 3.6.1.1. In addition, standard traffic control measures associated with temporary road/lane closures would apply, including detour signage, cones, construction area signage, and flagmen. As short-term construction traffic would not significantly degrade local intersection LOS, no additional mitigation measures are required.

**Residual Impacts**

As shown in Table 3.6-7, after application of MM TRANS-1, project construction activity impacts at Navy Way/Seaside Avenue would be less than significant. The final LOS would still be C, but the increase due to Reduced Project Alternative construction trips would be smaller than the 0.04 threshold used for Impact TRANS-1 as described above (Section 3.6.4.2). Residual impacts would be less than significant.

**NEPA Impact Determination**

As shown in Table 3.6-6, there would be a significant impact from construction activity under NEPA at one intersection, Navy Way/Seaside Avenue during the PM peak hour, due to construction auto traffic. The final LOS would be C, and Reduced Project Alternative construction trips would increase V/C by 0.062, greater than the 0.04 threshold used for Impact TRANS-1 as described above (Section 3.6.4.2). Thus, construction traffic from the Reduced Project Alternative would result in a significant temporary construction impact on ground transportation and circulation at this intersection.

Because Reduced Project Alternative construction would generate relatively small numbers of daily truck trips to begin with, and most materials (with the exception of cement) would be brought in during off-peak hours, project construction truck trips during the AM and PM peak periods are not expected to create any other significant impacts on the roadway system.

**Mitigation Measures**

Mitigation Measures 4F-1, 4F-2, 4F-4, and 4F-5 from the 1992 Deep Draft FEIS/FEIR would apply, as noted in Section 3.6.1.1. In addition, standard traffic control measures associated with any temporary road/lane closures would apply, including detour signage, cones, construction area signage, and flagmen. MM TRANS-1 would also be required to reduce significant impacts on the Ferry Street/SR-47 EB on-ramp.
Residual Impacts

As shown in Table 3.6-8, after application of MM TRANS-1, project construction activity impacts at Navy Way/Seaside Avenue would be less than significant. The final LOS would still be C, but the increase due to Reduced Project Alternative construction trips would be smaller than the 0.04 threshold used for Impact TRANS-1 as described above (Section 3.6.4.2). Residual impacts would be less than significant.

3.6.4.3.3.2 Operational Impacts

Impact TRANS-2: Long-term vehicular traffic associated with the Reduced Project Alternative would not substantially affect volume/capacity ratios or levels of service on regional intersections.

The only vehicular trips accessing the Reduced Project Alternative sites on a regular basis during operation would be those of the Marine Terminal and tank farm employees, personnel manning the security gates, and workers periodically checking the tanks and pipelines.

As with the proposed Project, employees would access the Marine Terminal via Navy Way. The Reduced Project Alternative would require a total of approximately 7 truck deliveries per week of supplies and materials to support operations of crew on board a vessel at the Berth 408. Marine Terminal operations would not require tanker trucks to accommodate throughput of crude oil at Berth 408. Deliveries would occur by vessel only and would be transported via pipeline from Pier 400 to the tank farm sites, refineries, and other Plains pipeline systems nearby.

Reduced Project Alternative operational employment to support operations at Berth 408 would be nearly identical to the proposed Project, with a small decrease in the estimated Port pilot and tugboat crews due to the smaller number of vessel calls at Berth 408. Operational employment related to operations of the Marine Terminal, tank farm sites, and pipeline and storage tank inspection and maintenance would be identical to the proposed Project. Because the Reduced Project Alternative also includes increased vessel calls at existing terminals in the San Pedro Bay Ports, there could be an increased need for Port pilots and tugboat crews to support the higher number of vessel calls. However, these personnel would not contribute trips to the same intersections as those traveling to the Marine Terminal and Tank Farm Site areas. For the purposes of analyzing ground transportation impacts, Reduced Project Alternative operations would result in a maximum increase of 80 employee vehicular trips per day (40 during the AM peak hour and a maximum of 40 during the PM peak hour). The addition of 40 PM peak hour operational trips is below the threshold of 43 PM peak hour trips required by LADOT to perform a traffic analysis of study area intersections for a proposed project (see LADOT Policies and Procedures – Revised August 2003) and, therefore, a detailed intersection analysis is not required.

CEQA Impact Determination

Traffic modeling results, summarized in Table 3.6-9, show that the one intersection impacted by operational activities (i.e., Navy Way/Seaside Avenue) would continue to operate at LOS B during the AM peak hour and LOS C during the PM peak hour,
3.6 Ground Transportation and Circulation

with an increase of only 0.008 in V/C due to Reduced Project Alternative operations traffic. Impacts on transportation would be less than significant.

Mitigation Measures

As long-term vehicular traffic would not significantly degrade local intersection LOS, no additional mitigation measures are required.

Residual Impacts

Residual impacts would be less than significant.

NEPA Impact Determination

Traffic modeling results, summarized in Table 3.6-10, show that the one intersection impacted by operational activities (i.e., Navy Way/Seaside Avenue) would continue to operate at LOS B during the AM peak hour and LOS C during the PM peak hour, with an increase of only 0.008 in V/C due to Reduced Project Alternative operations traffic. Impacts on transportation would be less than significant.

Mitigation Measures

As long-term vehicular traffic would not significantly degrade local intersection LOS, no additional mitigation measures are required.

Residual Impacts

Residual impacts would be less than significant.

Impact TRANS-3: Reduced Project Alternative operations would not result in a significant increase in related public transit use.

Although the Reduced Project Alternative would result in additional on-site employees, the increase in work-related trips using public transit would be negligible. Port terminals generate extremely low transit demand for several reasons. The primary reason that Port workers do not use public transit is that many terminal workers must first report to union halls for dispatch before proceeding to the terminal to which they have been assigned. Most workers prefer to use a personal automobile to facilitate this disjointed travel pattern. Also, Port workers live throughout the southern California region and do not have access to the few bus routes that serve the Port. Additionally, Port workers’ incomes are generally higher than similarly skilled jobs in other areas and higher incomes correlates to lower transit usage. Finally, parking at the Port is readily available and free, which encourages workers to drive to work. Therefore, it is expected that less than five work trips would be made on public transit, which could easily be accommodated by existing bus transit services and would not result in a demand for transit services which would exceed the supply of such services. Observations of transit usage in the area for bus routes that serve the project area (MTA routes 446 and 447) revealed that the buses are currently not operating near capacity and would be able to accommodate this level of increase in demand without exceeding supply.
### CEQA Impact Determination

Impacts due to additional demand on local transit services would be less than significant under CEQA.

### Mitigation Measures

No mitigation required.

### Residual Impacts

Less than significant impacts.

### NEPA Impact Determination

Impacts due to additional demand on local transit services would be less than significant under NEPA.

### Mitigation Measures

No mitigation required.

### Residual Impacts

Less than significant impacts.

### Impact TRANS-4: Reduced Project Alternative operations would not result in a significant increase in freeway congestion.

According to the CMP TIA Guidelines, a traffic impact analysis is required at the following:

- CMP arterial monitoring intersections, including freeway on-ramp or off-ramp, where the Project or its alternatives would add 50 or more trips during either the AM or PM weekday peak hours.
- CMP freeway monitoring locations where the Project or its alternatives would add 150 or more trips during either the AM or PM weekday peak hours.

Per CMP guidelines, an increase of 0.02 or more in the demand-to-capacity (D/C) ratio with a resulting LOS F is deemed a significant impact.

The closest CMP arterial monitoring station to the Reduced Project Alternative is Alameda Street/Pacific Coast Highway. The Project (with a maximum of 40 AM peak hour inbound trips and 40 PM peak hour outbound trips, as documented above) would add less than 50 trips through this intersection, and, therefore, no CMP system analysis is required at this location.

The closest freeway monitoring station is located at I-110 at “C”-Street and I-710 at Willow Street. The results of the analysis indicate that the Reduced Project Alternative (as it would have a maximum of 40 AM peak hour inbound trips and 40 PM peak hour outbound trips) would not result in more than 150 additional trips on
either of the CMP freeway monitoring locations; therefore, no CMP system analysis is required at those locations.

**CEQA Impact Determination**
Traffic impacts would be less than significant under CEQA.

**Mitigation Measures**
No mitigation required.

**Residual Impacts**
Less than significant impacts.

**NEPA Impact Determination**
Traffic impacts would be less than significant under NEPA.

**Mitigation Measures**
No mitigation required.

**Residual Impacts**
Less than significant impacts.

**Impact TRANS-5: Reduced Project Alternative operations would not cause an increase in rail activity that would cause delays in regional traffic.**

Rail activity causes delay at crossings where the trains pass and cause auto and truck traffic to stop. The amount of delay is related to the length of the train, the speed of the train and the amount of auto and truck traffic that is blocked.

The Reduced Project Alternative would not cause an increase in rail traffic. All product would be transported by pipeline.

**CEQA Impact Determination**
No impact.

**Mitigation Measures**
No mitigation required.

**Residual Impacts**
No impact.
**NEPA Impact Determination**

No impact.

**Mitigation Measures**

No mitigation required.

**Residual Impacts**

No impact.

**3.6.4.3.4 Summary of Impact Determinations**

The following Table 3.6-11 summarizes the CEQA and NEPA impact determinations of the proposed Project and its alternatives related to Ground Transportation and Circulation, as described in the detailed discussion in Sections 3.6.4.3.1 through 3.6.4.3.3. This table is meant to allow easy comparison between the potential impacts of the proposed Project and its alternatives with respect to this resource. Identified potential impacts may be based on Federal, State, or City of Los Angeles significance criteria, Port criteria, and the scientific judgment of the report preparers.

For each type of potential impact, the table describes the impact, notes the CEQA and NEPA impact determinations, describes any applicable mitigation measures, and notes the residual impacts (i.e. the impact remaining after mitigation). All impacts, whether significant or not, are included in this table. Note that impact descriptions for each of the alternatives are the same as for the proposed Project, unless otherwise noted.

3.6.4.4 Mitigation Monitoring

Potentially significant impacts would occur during proposed Project construction. The following measures would be incorporated into contract specifications to ensure traffic and circulation impacts are minimized to the greatest extent feasible.

Mitigation Measures from the 1992 Deep Draft Final EIS/EIR that are Applicable to the Proposed Project:

<table>
<thead>
<tr>
<th>Impact TRANS-1: Construction of the Reduced Project Alternative would result in a short-term, temporary increase in auto traffic.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>MM 4F-1: Encourage Carpooling.</strong></td>
</tr>
<tr>
<td>Mitigation Measure</td>
</tr>
<tr>
<td>Timing</td>
</tr>
<tr>
<td>Methodology</td>
</tr>
<tr>
<td>Responsible Parties</td>
</tr>
<tr>
<td><strong>MM 4F-2: Efficient Use of Truck Trips.</strong></td>
</tr>
<tr>
<td>Mitigation Measure</td>
</tr>
<tr>
<td>Timing</td>
</tr>
<tr>
<td>Methodology</td>
</tr>
<tr>
<td>Responsible Parties</td>
</tr>
<tr>
<td><strong>MM 4F-4: Ridesharing, Parking Management, Auto Use/Truck Movement Restriction.</strong></td>
</tr>
<tr>
<td>Mitigation Measure</td>
</tr>
<tr>
<td>Timing</td>
</tr>
<tr>
<td>Methodology</td>
</tr>
<tr>
<td>Responsible Parties</td>
</tr>
<tr>
<td><strong>MM 4F-5: Literature on VMT Reduction and Rideshare.</strong></td>
</tr>
<tr>
<td>Mitigation Measure</td>
</tr>
<tr>
<td>Timing</td>
</tr>
<tr>
<td>Methodology</td>
</tr>
<tr>
<td>Responsible Parties</td>
</tr>
</tbody>
</table>
Mitigation Measures Developed in this Draft SEIS/SEIR:

<table>
<thead>
<tr>
<th>Impact TRANS-1: Proposed Project construction would result in a short-term, temporary increase in auto traffic.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>MM TRANS-1: Outbound Construction Worker Routing</strong></td>
</tr>
<tr>
<td><strong>Mitigation Measure</strong></td>
</tr>
<tr>
<td><strong>Timing</strong></td>
</tr>
<tr>
<td><strong>Methodology</strong></td>
</tr>
<tr>
<td><strong>Responsible Parties</strong></td>
</tr>
<tr>
<td><strong>Residual Impacts</strong></td>
</tr>
</tbody>
</table>
