5.0 PROGRAM ALTERNATIVES

5.1 Introduction

This chapter presents a description of the alternatives to the proposed Program, evaluates their environmental impacts, and compares the impacts of each alternative to those of the other alternatives, including the proposed Program. The alternatives have been qualitatively analyzed in this Draft PEIR at a level that provides sufficient information about the environmental impacts of each alternative for comparative purposes and allows informed decision-making.

5.1.1 CEQA Requirements

CEQA Guidelines Section 15126.6 requires that an EIR present a range of reasonable alternatives to a proposed project or to the location of a project that could feasibly achieve a majority of the basic project objectives, but would avoid or substantially lessen one or more significant environmental impacts of the project. The range of alternatives required in an EIR is governed by a “rule of reason” that requires an EIR to set forth only those alternatives necessary to permit a reasoned choice. An EIR need not consider every conceivable alternative to a project. Rather, the alternatives should be limited to those meeting the project objectives, are ostensibly feasible, and would avoid or substantially lessen at least one of the significant environmental effects of the project (CEQA Guidelines Section 15126.6[f]). The EIR must identify the environmentally superior alternative, which cannot be the No Project (No-Program) Alternative. Alternatives may be eliminated from detailed consideration in the EIR if they fail to meet most of the project objectives, are infeasible, or do not avoid or substantially lessen any significant environmental effects (CEQA Guidelines Section 15126.6[c]).

CEQA Guidelines explain that the evaluation of project alternative feasibility can consider “site suitability, economic viability, availability of infrastructure, general plan consistency, other plans or regulatory limitations, jurisdictional boundaries, and whether the proponent can reasonably acquire, control or otherwise have access to the alternative site.” The EIR is also not required to evaluate an alternative that has an effect that cannot be reasonably identified or that has remote or speculative implementation, and that would not achieve the basic proposed project objectives.
According to CEQA regulations, the alternatives section of an EIR is required to:

- Rigorously explore and objectively evaluate a reasonable range of alternatives;
- Include reasonable alternatives not within the lead agency’s jurisdiction or Congressional mandate, if applicable;
- Include a “no-project” alternative;
- Develop substantial treatment to each alternative, including the proposed action, so that reviewers may evaluate their comparative merits;
- Identify the environmentally superior alternative;
- Include appropriate mitigation measures (when not already part of the proposed action or alternatives); and,
- Present the alternatives that were eliminated from detailed study and briefly discuss the reasons for elimination.

5.1.2 Selection Criteria

This Draft PEIR presents a reasonable range of alternatives, pursuant to CEQA, that are consistent with LAHD’s legal mandates under the Port of Los Angeles Tidelands Trust (Los Angeles City Charter, Article VI, Section 601), its leasing policy (LAHD 2006), and the CCA (20 PRC 30700 et seq.). The selection, development, and evaluation of alternatives analyzed in this Draft PEIR are in accordance with CCA policies that identify the coastal zone as a distinct and valuable natural resource. The Port is one of only five locations in the state identified in the CCA for the purposes of international maritime commerce (PRC Sections 30700 and 30701). LAHD’s mandates identify the Port and its facilities as a primary economic/coastal resource of the state and an essential element of the national maritime industry for promotion of commerce, navigation, fisheries, environmental preservation, and public recreation.

The alternative selection process considered the state’s basic goals for the coastal zone, as codified in Section 30001.5 of the CCA, which are to: 1) protect, maintain, enhance, and restore the quality of the coastal zone environment and its natural and artificial resources; 2) assure orderly, balanced utilization and conservation of coastal zone resources, taking into account the social and economic needs of the people of the state; 3) maximize public access to and along the coast and public recreational opportunities in the coastal zone, consistent with sound resource conservation principles and the rights of private property owners; and, 4) assure priority for coastal-dependent and coastal-related development over other development on the coast.

The overall purpose of the PMPU is to create a consolidated planning document that updates the existing PMP, as amended, with policies and guidelines that reflect current community and environmental conditions and account for trends in foreign and domestic waterborne commerce, navigation, and fisheries. LAHD identified several selection criteria to develop reasonable alternatives that meet the majority of the PMPU’s objectives. These criteria include a planning document that would:
1. Allow the Port to develop in a manner that is consistent with federal, state, county, and city laws, including the CCA and Charter of the City of Los Angeles;

2. Integrate economic, engineering, environmental, and safety considerations into the Port development process for measuring the long-term impact of varying development options on the Port's natural and economic environment;

3. Promote the orderly, long-term development and growth of the Port by establishing functional areas for Port facilities and operations; and,

4. Allow the Port to adapt to changing technology, cargo trends, regulations, and competition from other U.S. and foreign ports.

5.1.3 Screening Process

LAHD conducted a screening process per CEQA Guidelines to determine which alternatives would be evaluated in detail in the Draft PEIR and which would be eliminated from further consideration. In screening the alternatives, LAHD considered the following factors:

- Would the alternative achieve the Program objectives?

- Would the alternative avoid or reduce any significant environmental effects?

- Is the alternative feasible?

As discussed in Chapter 2.0, Program Description, the screening process reflects input from Port stakeholders, including tenants, Port customers, government agencies, and the community, provided during public workshops, tenant outreach, and formal planning processes, such as the Terminal Island Land Use Plan. During this process, LAHD received comments on a variety of issues including land use designations, preservation of historic resources, implementation of environmental conservation efforts, increasing cargo diversity, and providing public access opportunities for the San Pedro and Wilmington communities. As part of the Terminal Island Land Use Plan process, LAHD also assessed the land use and facilities requests of commercial fishermen, the presence of historical properties, the scrap metal industry, and demand for commercial boatyard facilities in the region. LAHD considered this input as part of their alternatives screening process.

Alternatives consisting of minor changes to the land use plan were not considered viable alternatives to the proposed Program. The PMPU uses a Port-wide approach for achieving the planning objectives of minimizing conflicts, maximizing accessibility, and allocating land uses to accommodate future trends in waterborne commerce. LAHD considered the configuration of planning areas and land use designations as the most effective approach for achieving the PMPU objectives. Additionally, alternatives consisting of minor reassignments of land uses for individual properties would not be expected to significantly reduce environmental impacts. Other possible alternatives that would result in substantially different uses for the Port, such as a residential land uses, would be inconsistent with legal mandates under the Port of Los Angeles Tidelands Trust and CCA, which identify the Port as an essential element of the national maritime industry for promotion of commerce, navigation, fisheries, and harbor operations. In addition, land uses that do not give highest priority to navigation, shipping, and necessary support and access
facilities to accommodate the demands of foreign and domestic waterborne commerce would be inconsistent with the Port of Los Angeles Strategic Plan 2012-2017 and the Port’s Leasing Policy. Therefore, the Port does not consider land use plans that would deviate from the Port’s legal mandate, strategic plan, and Leasing Policy to be viable alternatives to the proposed Program.

5.1.4 Alternatives Considered But Eliminated From Further Consideration

5.1.4.1 Port Community Advisory Committee Port Master Plan

The Port Community Advisory Committee (PCAC) submitted proposed changes to the PMP that focused on creating a “bridge to breakwater” non-industrialized community area along the San Pedro and Wilmington waterfronts (PCAC 2004). The proposed revisions consisted of boundary and land use designation changes, including a focus on modifying PMP planning area boundaries to adequately define the “bridge to breakwater” area and updating allowable land uses to ensure adequate public access to the waterfront. Key elements of the PCAC plan were incorporated into the PMPU, such as:

- Areas of the Port that are adjacent to the community of San Pedro would not allow general cargo or liquid bulk land uses;
- The Wilmington Waterfront area is designated for recreational, commercial, and institutional land uses. Cargo handling designations, including container, liquid bulk, commercial fishing, dry bulk, and industrial would not be allowed;
- The Anchorage Soil Storage Site would be designated an open space land use;
- The existing Wilmington marinas would continue to be designated recreational boating;
- Terminal Island would continue to focus on heavy cargo handling land use designations, including container, liquid bulk, dry bulk, and institutional; and,
- Fish harbor would continue to be focused on commercial fishing land uses.

Other elements of the PCAC plan were inconsistent with Program objectives. In particular, the alternative in the PCAC plan that would not allow liquid bulk land uses near Wilmington was eliminated for the following reasons:

- This PCAC alternative would not avoid or reduce significant environmental impacts. The RMP ensures that liquid bulk terminals located at the Port do not overlap with vulnerable resources, including visitor serving areas. Terminals that are not in compliance with the RMP must become consistent with the plan either by making safety improvements, changing the commodity mix they handle, or by relocating. Existing liquid bulk terminals, including those located in PMPU area, are consistent with the RMP. Furthermore, the development of new liquid bulk facilities would be consistent with the RMP;
The PCAC recommendation to relocate liquid bulk uses to Terminal Island is infeasible. Terminal Island is not a suitable relocation site since there is insufficient berthing capacity. The majority of Terminal Island is held in long-term leases with cargo terminals. The only berthing opportunities for liquid bulk ships would be at Berths 240 and 301. A berth is available at the southernmost face of Pier 400, however it would be extremely costly to develop a marine oil terminal there because the berth would be constructed in the Outer Harbor, and a complex network of pipelines would be required to reach backlands that could accommodate a tank farm; and,

Another consideration is that it would economically infeasible for existing tenants to relocate. Proposed relocations would require costly site remediation for their current facilities, in addition to the cost of berth, pipeline, and storage tank improvements. It would be extremely difficult for the LAHD to retain liquid bulk tenants if relocations were forced upon them, because of the cost burden. This could significantly impact the Port’s ability to import liquid bulk commodities and receive their associated revenues.

5.1.4.2 Other Alternatives

As discussed in Chapter 2.0, Program Description, the Terminal Island Land Use Plan considered long-term land use and facility improvements for Terminal Island (Cargo Velocity LLC 2012), and applicable portions of the plan were incorporated into the PMPU. However, the Terminal Island Land Use Plan only considered Terminal Island and it did not address other planning areas within the PMPU area. Therefore, based on the relatively limited geographic scope the Terminal Island Land Use Plan was not considered a viable Program alternative.

LAHD also considered a cargo specialization alternative that would develop container and break bulk as the cargo handling facilities and phase out liquid bulk and dry bulk operations at the Port. Visitor serving uses would remain, including commercial, open space, and recreational boating. This alternative potentially would streamline operations in the port; focus infrastructure spending on specialized cargo uses; and reduce or eliminate environmental impacts associated with dry bulk and liquid bulk operations. However, LAHD dismissed this alternative for the following reasons: 1) the Port would be underutilized if demand for break bulk or container dropped; and, 2) this alternative would not meet the needs of the state with regard to liquid bulk and dry bulk cargo. Thus, this alternative would not fulfill the objective of accommodating cargo diversity and trends in waterborne commerce and would not be consistent with the state law objective regarding liquid bulk supplies.

The other program alternative considered by the LAHD is the No Fill Alternative, which is carried forward for evaluation in this PEIR (Section 5.3, Alternative 2 – No Fill Alternative).

5.1.5 Alternatives Carried Forward for Analysis

In addition to the No-Project (No-Program) Alternative, alternatives for an EIR usually take the form of a reduced project size, different project design, or suitable
alternative project sites. Based on the screening analysis conducted by LAHD, two
alternatives to the proposed Program were carried forward for analysis:

- Alternative 1 – No-Program Alternative (Section 5.2); and,
- Alternative 2 – No Fill Alternative (Section 5.3).

Similar to the analysis of the proposed Program (Chapter 3.0, Environmental
Analysis), assessments of No-Program Alternative and the No Fill Alternative do not
include detailed analysis of the proposed appealable/fill projects because sufficient
project-specific information currently is not available. Analyses of individual
appealable/fill projects are deferred to future project-specific environmental
documents.

5.2 Alternative 1 – No-Program Alternative

5.2.1 Alternative Description

Under CEQA, the lead agency is required to evaluate a No-Project Alternative that
represents what would reasonably be expected to occur in the foreseeable future if the
proposed project (or Program) were not approved based on current plans and
consistent with available infrastructure and community services. CEQA Guidelines
Section 15126.6(e) states:

“The specific alternative of "no project" shall also be evaluated along with its
impact. The purpose of describing and analyzing a no project alternative is to
allow decision makers to compare the impacts of approving the proposed project
with the impacts of not approving the proposed project. The no project
alternative analysis is not the baseline for determining whether the proposed
project's environmental impacts may be significant, unless it is identical to the
existing environmental setting analysis which does establish that baseline.”

“When the project is the revision of an existing land use or regulatory plan,
policy or ongoing operation, the "no project" alternative will be the continuation
of the existing plan, policy or operation into the future. Typically this is a
situation where other projects initiated under the existing plan will continue
while the new plan is developed. Thus, the projected impacts of the proposed
plan or alternative plans would be compared to the impacts that would occur
under the existing plan.”

The No-Program Alternative would not update the PMP, and land uses would remain
as specified in the existing (1980) PMP and certified amendments. The No-Program
Alternative would allow build-out of future projects that are consistent with the
existing PMP. For example, projects that could occur under the PMPU, including
construction and operation of container or marine oil terminals, could also occur
under the No-Program Alternative as long as the projects are consistent with the
PMP. In contrast, cut and fill projects are not consistent with the PMP and are not
included in the No-Program Alternative, as are changes to designated land uses.
However, it is possible that projects similar to the PMPU appealable/fill projects
could occur in the future, under an amended PMP scenario. Nevertheless, the only
differences between the proposed Program and the No-Program Alternative are the anticipated projects with a cut/fill component and the associated land use changes that are included in the proposed Program. Further, the assessment of impacts associated with the No-Program Alternative does not consider project-specific and related cumulative impacts associated with the approved and certified projects because these impacts have been accounted for in the environmental documents prepared for those projects.

5.2.2 Impact Analysis

5.2.2.1 Aesthetics/Visual Resources

Under the No-Program Alternative, future projects constructed and operated under the existing PMP would be of the types that are already present in the Port, and consistent in character with the array of existing Port features. Impacts that these projects would have on aesthetics/visual resources would not be different from those anticipated under the PMPU. Therefore, under the No-Program Alternative, no new impacts would occur beyond those that presently exist under the PMP.

5.2.2.2 Air Quality and Greenhouse Gases

The No-Program Alternative would include future projects constructed and operated under the existing PMP that would be expected to generate a range of significant project-specific and cumulative air quality impacts. However, these impacts would be similar to those associated with the PMPU, as evaluated in Section 3.2, Air Quality and Greenhouse Gases, and other projects evaluated in Chapter 4.0, Cumulative Analysis. Differences between the No-Program and proposed Program alternatives would be associated with emissions from construction and operation of appealable/fill projects and land use changes under the PMPU, although it is possible that projects similar to the PMPU appealable/fill projects could occur in the future, under an amended PMP scenario, and result in impacts comparable to those described for the proposed Program. Therefore, under the No-Program Alternative, no new impacts would occur beyond those that presently exist under the PMP.

5.2.2.3 Biological Resources

Under the No-Program Alternative, future projects constructed and operated under the existing PMP would be expected to result in significant project-specific and cumulative impacts to biological resources. These impacts would be similar to those associated with the PMPU, as evaluated in Section 3.3, Biological Resources, and other projects evaluated in Chapter 4.0, Cumulative Analysis. Differences between the No-Program and proposed Program alternatives would be associated with the appealable/fill projects and land use changes under the PMPU. In particular, the No-Program Alternative would not result in the loss of EFH and marine habitat due to project-related fills, although it is possible that projects similar to the PMPU appealable/fill projects could occur in the future, under an amended PMP scenario, and result in impacts comparable to those described for the proposed Program.
There would be an ongoing low potential for significant and unavoidable residual impacts to biological resources associated with future increases in vessel calls (e.g., related to collisions with marine mammals) under the No-Program Alternative. However, the Port’s VSRRP has the potential to reduce the incremental increase in collision risk with marine mammals. Additionally, it is not possible to fully avoid the potential for a significant impact to sensitive species or habitats from an oil spill, even though the probability of occurrence is very low. However, similar to the proposed Program, the incremental increased risk of introducing non-native, invasive species into the Port (e.g., due to ballast water) that could disrupt local biological communities cannot be fully avoided with current technology and would be significant and unavoidable, although the low probability risk has the potential to become further reduced as a result of recently enacted legislation and advances in technology. Regardless, under the No-Program Alternative no new impacts to biological resources would occur beyond those that presently exist under the PMP.

5.2.2.4 Cultural Resources

As discussed in Section 3.4, Cultural Resources, recorded and/or unknown archaeological sites are potentially located within and adjacent to the PMPU area. The PMPU area also includes various historical resources that are listed or eligible for listing on a federal, state, or local register. In addition, recorded and/or unknown paleontological resources are potentially located within and adjacent to the PMPU area. Under the No-Program Alternative, future projects constructed and operated under the existing PMP would be expected to result in potentially significant but mitigable project-specific and cumulative impacts to cultural resources. These impacts would be similar to those associated with the PMPU, as evaluated in Section 3.4, Cultural Resources, and other projects evaluated in Chapter 4.0, Cumulative Analysis. Differences between the No-Program and proposed Program alternatives would be associated with the proposed appealable/fill projects and land use changes under the PMPU. Under the No-Program Alternative, potential impacts to cultural resources associated with the proposed appealable/fill projects and land use changes are not expected to occur, although it is possible that projects similar to the appealable/fill projects could occur in the future, under an amended PMP scenario, and result in impacts comparable to those described for the proposed Program. Regardless, under the No-Program Alternative, no new impacts to cultural resources would occur beyond those that presently exist under the PMP.

5.2.2.5 Geology

Under the No-Program Alternative, future projects constructed and operated under the existing PMP would be expected to result in less than significant impacts to geology that would be similar to those described for the proposed Program. Construction of projects under the PMP would be subject to established building codes and LAHD design criteria, including incorporation of modern construction engineering and safety standards. As a result, impacts due to seismically-induced ground failure, land subsidence/soil settlement, expansive soils, and unstable soil conditions would be less than significant. Because the topography in the PMPU area is relatively flat and mostly paved, projects that are approved and certified under the PMP would not be subject to landslides or mudflows and no impacts would occur. Development under this alternative would be susceptible to tsunami and seiche events. However, impacts would
be less than significant due to emergency response planning, similar to MM GEO-1. Regardless, under the No-Program Alternative, no new impacts to geology would occur beyond those that presently exist under the PMP.

5.2.2.6 Groundwater and Soils

Under the No-Program Alternative, future projects constructed and operated under the existing PMP would be expected to result in less than significant impacts to groundwater and soils that would be comparable to those described for the proposed Program. Similar to the proposed Program, construction of projects approved and certified under the PMP would adhere to LAHD lease measures (e.g., site remediation and a contamination contingency plan) and comply with existing government agency regulations. Under the No-Program Alternative, no new impacts to groundwater and soils would occur beyond those that presently exist under the PMP.

5.2.2.7 Hazards and Hazardous Materials

Under the No-Program Alternative, future projects constructed and operated under the existing PMP would result in impacts that would be similar to the potential risks associated with the proposed Program. Specifically, potential impacts associated with the small but foreseeable risk of an accidental release of hazardous materials, with subsequent adverse effects on sensitive environmental resources, would be significant. However, residual impacts would be reduced to less than significant with MM HAZ-1 and MM HAZ-2. No new impacts from hazards and hazardous materials would occur beyond those that presently exist under the PMP.

5.2.2.8 Land Use

The No-Program Alternative would not update the PMP, and land uses would remain as specified in the existing PMP and certified amendments. The No-Program Alternative would include build-out of projects already approved and certified under the PMP, as well as other future and appealable projects that would not require a PMP amendment. Construction activities associated with the projects approved and certified under the PMP would not conflict with plans or policies adopted for the purpose of avoiding environmental impacts. Furthermore, projects approved and certified under the PMP would not conflict with the General Plan or adopted environmental goals or policies contained in other applicable plans adopted for the purpose of avoiding environmental impacts. Because the No-Program Alternative would not result in any changes to the physical environment, other than those addressed in the environmental documents for allowable approved and certified projects, there would be no new impacts to land use.

5.2.2.9 Noise

Under the No-Program Alternative, noise and vibration impacts from construction and operation of future projects under the PMP would be similar to those described for the proposed Program. Given the absence of project-specific details to assess the potential magnitude of these impacts, this analysis concludes that construction
activities under the No-Program Alternative would have the potential to result in
significant noise impacts. Residual impacts would depend on project-specific factors;
however, noise impacts during construction would be significant and unavoidable.
Operation of future projects under the No-Program Alternative would not result in a
substantial change in the noise environment within the PMPU area or result in
vibration that exceeds thresholds. Regardless, under the No-Program Alternative, no
new impacts to noise would occur beyond those that presently exist under the PMP.

5.2.2.10 Public Services

Under the No-Program Alternative, future projects constructed and operated under
the existing PMP would be expected to result in impacts to public services that would
be similar to those described for the proposed Program. Specifically, the No-Program
Alternative would have many of the same impacts to law enforcement and fire
protection as identified for the proposed Program. Therefore, impacts would be less
than significant with mitigation, such as MM PS-1, as described for the proposed
Program. Regardless, under the No-Program Alternative, no new impacts to public
services would occur beyond those that presently exist under the PMP.

5.2.2.11 Recreation

Under the No-Program Alternative, future projects constructed and operated under
the existing PMP would be expected to result in less than significant impacts to
recreational resources and would be similar to those described for the proposed
Program since there would be a comparable demand on recreational resources. Under
the No-Program Alternative, no new impacts to recreational resources would occur
beyond those that presently exist under the PMP.

5.2.2.12 Transportation and Circulation

For the No-Program Alternative, traffic growth associated with future projects
constructed and operated under the PMP would still occur. Even without the
appealable cut/fill projects and land use changes under the proposed Program, the
Port is expected to reach maximum throughput by 2035 through implementation of
various projects, some of which have already been approved and certified under the
PMP. Therefore, traffic and circulation impacts for the No-Program Alternative
would be comparable to those for the proposed Program and potentially significant.
Impacts to vessel traffic from construction and operation of the No-Program
Alternative would be less than significant. Regardless, under the No-Program
Alternative, no new impacts to traffic would occur beyond those that presently exist
under the PMP.

5.2.2.13 Utilities

Under the No-Program Alternative, future projects constructed and operated under
the existing PMP would be expected to result in less than significant impacts to
utilities. These impacts would be comparable to those described for the proposed
Program because utility demands (water, wastewater, storm drainage, solid waste,
gas, and electricity) would be similar. Under the No-Program Alternative, no new impacts to utilities would occur beyond those that presently exist under the PMP.

### 5.2.2.14 Water Quality, Sediments, and Oceanography

Under the No-Program Alternative, impacts to water quality, sediments, or oceanography from construction and operation of projects under the PMP would be less than significant and similar to those described for the proposed Program. However, the temporary and localized impacts from in-water construction and operation of the cut/fills projects associated with the proposed Program would be avoided, although it is possible that projects similar to the PMPU appealable/fill projects could occur in the future, under an amended PMP scenario, and result in impacts comparable to those described for the proposed Program. In the absence of future fill projects under the PMP, impacts to surface water and water flow patterns would be reduced slightly compared to the proposed Program.

Future changes to water and sediment quality and oceanography in the Port under the No-Program Alternative would reflect factors related to the operations of existing facilities or construction and operation of new projects, consistent with the existing PMP. These impacts potentially would be offset by results achieved by the WRAP, other Port policies related to water and sediment quality, and Port-specific and watershed TMDLs that are expected to contribute to future improvements in water and sediment quality throughout the Port. Regardless, under the No-Program Alternative, no new impacts to water quality, sediments, or oceanography would occur beyond those that presently exist under the PMP.

### 5.3 Alternative 2 - No Fill Alternative

#### 5.3.1 Alternative Description

The No Fill Alternative would eliminate the cut/fill projects and associated land use changes (container storage) associated with the fill projects under PMPU. All other appealable projects (i.e., Berths 187-189 Liquid Bulk Relocation, Tri Marine Expansion, 338 Cannery Street Adaptive Reuse, and Al Larson Marina) and land use changes in the proposed Program would be included in the No Fill Alternative.

#### 5.3.2 Impact Analysis

##### 5.3.2.1 Aesthetics/Visual Resources

Under the No Fill Alternative, build-out of the other appealable projects and land use changes would be similar to projects already present in the Port and consistent in character with existing Port features. Because there would be no visual impacts, there would be no inconsistency with applicable rules and regulations. Therefore, no impacts to aesthetics/visual resources would occur under this alternative.
5.3.2.2 Air Quality and Greenhouse Gases

Under the No Fill Alternative, appealable projects other than the cut/fill projects and associated land use changes included in the proposed Program would generate a variety of project-specific and cumulative air quality impacts that would be similar to those for the proposed Program and other projects evaluated in Chapter 4.0, Cumulative Analysis.

Emissions from No Fill Alternative projects and land use changes would be lower than those associated with the proposed Program, due to the absence of contributions from container operations on fill land. Nevertheless, air quality and GHG impacts from construction and operation of the No Fill Alternative are expected to be significant and unavoidable because emissions, concentrations, and/or resultant health risks would exceed applicable standards or thresholds, similar to those discussed for the proposed Program.

Mitigation measures included for the proposed Program (MM AQ-1 through MM AQ-18 and MM GHG-1 through GHG-6) would be applicable to the No Fill Alternative, but residual impacts would remain significant.

5.3.2.3 Biological Resources

The other appealable projects that could occur under the No Fill Alternative would not construct new upland areas out of open water (i.e., fill) and, therefore, no loss of EFH and marine habitat would occur. Impacts to marine mammals and other special status species from construction and operation of appealable projects and land use changes would be slightly less than for the proposed Program and would be less than significant with mitigation.

Increased vessel calls could increase the risk of introducing non-native invasive species. Although federal and state regulations substantially reduce the risk of invasive species introductions, no feasible mitigation is currently available to totally prevent introduction of invasive species due to lack of proven technologies. Consequently, operations under the No Fill Alternative could result in significant and unavoidable impacts on marine biological communities, and residual impacts would remain significant.

5.3.2.4 Cultural Resources

As discussed in Section 3.4, Cultural Resources, recorded and/or unknown archaeological and paleontological sites are potentially located within and adjacent to the PMPU area. The PMPU area also includes various historical resources that are listed or eligible for listing on a federal, state, or local register. Under the No Fill Alternative, impacts would be slightly less than those described for the proposed Program because the three small cut/fill areas would not be built and there would be less potential to impact in-water archaeological or ethnographic resources, historical resources and paleontological resources. The No Fill Alternative impacts to cultural resources would be less than significant with implementation of the following mitigation measures, as applicable: MM CR-1, MM CR-2, MM CR-3, and MM CR-4.
5.3.2.5 Geology

Under the No Fill Alternative, proposed appealable projects (i.e., Berths 187-189 Liquid Bulk Relocation, Tri Marine Expansion, 338 Cannery Street Adaptive Reuse, and Al Larson Marina) and land use changes would be implemented, whereas the cut/fill projects and associated land use changes that are included in the proposed Program would not occur. Therefore, impacts would be slightly less than those described for the proposed Program. Accordingly, impacts on geology would be less than significant with mitigation that incorporates emergency response planning (MM GEO-1).

5.3.2.6 Groundwater and Soils

Under the No Fill Alternative, construction and operation of appealable projects and land use changes allowable under this alternative would adhere to LAHD lease measures (e.g., site remediation and a contamination contingency plan). Impacts to groundwater and soils from this alternative would be less than significant.

5.3.2.7 Hazards and Hazardous Materials

Under the No Fill Alternative, the potential for accident conditions involving the release of hazardous materials into the environment and accidents related to development within methane zones during construction and operation of appealable projects and land use changes allowable under this alternative would be comparable to risks associated with the proposed Program. Accordingly, potential impacts associated with the small but foreseeable risk of an accidental release of hazardous materials, with subsequent adverse effects on sensitive environmental resources, would be significant. However, residual impacts would be reduced to less than significant with MM HAZ-1 and MM HAZ-2.

5.3.2.8 Land Use

Under the No Fill Alternative, impacts to land use would be the same as those for the proposed Program. Construction activities associated with the proposed appealable projects under this alternative would not conflict with plans or policies adopted for the purpose of avoiding environmental impacts. Furthermore, the proposed appealable projects and land use changes would not conflict with the General Plan or adopted environmental goals or policies contained in other applicable plans adopted for the purpose of avoiding environmental impacts. Therefore, impacts would be less than significant.

5.3.2.9 Noise

The No Fill Alternative would involve four appealable projects, but no cut/fill projects. Compared to the proposed Program, this would reduce the potential for construction-related noise impacts. Nevertheless, as for the proposed Program, construction activities would likely involve noise levels that exceed standards at sensitive receptors, and impacts would be significant. Similar to the proposed Program, implementation of mitigation measures (MM NOI-1 through MM NOI-11) would be required during construction.
activities. Residual impacts would depend on project-specific factors; however, noise impacts during construction would be significant and unavoidable. Operation of allowable projects under the No-Program Alternative would not result in a substantive change in the noise environment within the PMPU area. Therefore, noise impacts from operations would be less than significant. Construction activities under the No Fill Alternative would not result in vibration that exceeds thresholds.

5.3.2.10 **Public Services**

Construction and operation of appealable projects and land use changes under the No Fill Alternative would have impacts to public services that would be comparable to those for the proposed Program. Specifically, the No Fill Alternative would have many of the same impacts to law enforcement and fire protection as identified for the proposed Program. Therefore, impacts would be less than significant with implementation of mitigation measure MM PS-1.

5.3.2.11 **Recreation**

Construction and operation of the appealable projects and land use changes allowable under the No Fill Alternative would have the same impacts to recreational resources as described for the proposed Program. Therefore, impacts would be less than significant.

5.3.2.12 **Transportation and Circulation**

The No Fill Alternative would generate slightly less traffic than the proposed Program due to elimination of the cut/fill projects and associated container storage areas. While the transportation and circulation impacts of the No Fill Alternative would be less than the proposed Program, it is expected that they would be sufficiently similar to result in the same significant and unavoidable impacts. MM TRANS-1 would be applicable to the No Fill Alternative but, as with the proposed Program, MM TRANS-1 may not reduce the impact to less than significant levels. Therefore, residual impacts would remain significant and unavoidable if the I-710 Corridor Project is not implemented by 2035. As described for the proposed Program, impacts to vessel traffic would be less than significant.

5.3.2.13 **Utilities**

Under the No Fill Alternative, construction and operation of appealable projects and land use changes would result in slightly less developed areas than the proposed Program. With less developed areas, future increases in utility demands would be comparatively less than the proposed Program, and impacts would be less than significant.

5.3.2.14 **Water Quality, Sediments, and Oceanography**

Under the No Fill Alternative, impacts to water quality, sediments, and oceanography would be less than significant when standard BMPs and other permit conditions
5.4 Comparison of Alternatives and the Proposed Program

5.4.1 Summary of Alternatives Impact Analysis

Table 5.4-1 presents a summary of the results of the analysis for the resource areas for the proposed Program and alternatives.

As indicated, the proposed Program has a similar number of significant unavoidable impacts compared to the No Fill and No-Program Alternatives, although overall the impacts from these other alternatives would be somewhat less than described for the proposed Program.

- N = No Impact
- M = Significant but Mitigable
- S = Significant Unavoidable

5.4.2 Resources with Significant Unavoidable Impacts

5.4.2.1 Proposed Program
The proposed Program would result in significant and unavoidable impacts to the following resources:

- Air Quality and Greenhouse Gases;
- Biology;
- Noise; and,
- Transportation and Circulation.

**Air Quality and Greenhouse Gases.** As discussed in Section 3.2, Air Quality and Greenhouse Gases, construction and operation of the proposed appealable/fill projects and land use changes under the proposed Program would result in significant and unavoidable impacts related to several impact criteria (Impacts AQ-1, AQ-2, AQ-3, AQ-4, AQ-7, and GHG-1). MM AQ-1 through MM AQ-18 and MM GHG-1 through GHG-6 would reduce the magnitude of impacts, but residual impacts would remain significant.

**Biology.** As discussed in Section 3.3, Biological Resources, increased vessel calls associated with the proposed appealable/fill projects and land use changes under the proposed Program could increase the risk of introducing non-native invasive species. Federal and state regulations substantially reduce the risk of invasive species introductions by requiring seagoing vessels to comply with ballast water management, marine biofouling, and sediment management requirements. While more vessels will be required to comply with these requirements through 2016, treatment system technologies have yet to be proven 100 percent effective. Consequently, it is not possible to ensure that no non-native species are introduced to the harbor environment, nor is it possible to ensure that introduced species are not invasive. Accordingly, it is not possible to fully avoid the potential for invasive species introductions to disrupt marine biological communities. No feasible mitigation is currently available to completely prevent introduction of invasive species due to lack of proven technologies and the phased schedule of vessel compliance with new regulations.

**Noise.** As discussed in Section 3.9, Noise, construction of the proposed appealable/fill projects under the proposed Program would generate noise levels that exceed thresholds associated with significant noise impacts (Impact NOI-1). Mitigation measures (MM NOI-1 through MM NOI-11) would be implemented to reduce noise levels where possible, but resulting noise levels would still exceed thresholds, and residual impacts would remain significant.

**Transportation and Circulation.** As discussed in Section 3.12, Transportation and Circulation, operation of the proposed appealable/fill projects under the proposed Program (Impact TRANS-4) would result in significant traffic impacts to the I-710 freeway. MM TRANS-1 would reduce potentials for traffic congestion. However, implementation of MM TRANS-1 may not reduce the impact to less than significant levels. Therefore, residual impacts would remain significant if the I-710 Corridor Project is not implemented by 2035.

### 5.4.2.2 Alternative 1 – No-Program Alternative

The No-Program Alternative would result in significant and unavoidable impacts to the following resources:
5.4.2.3 Alternative 2 – No Fill Alternative

The No Fill Alternative would result in significant and unavoidable impacts to the following resources:

- Air Quality and Greenhouse Gases;
- Biology;
- Noise; and,
- Transportation and Circulation.

In general, significant and unavoidable impacts from the No Fill Alternative to air quality/GHGs, biology, and noise would be slightly less than those described for the proposed Program, whereas transportation/circulation impacts would be comparable.

5.4.3 Resources with Significant Impacts that Can Be Mitigated to Less than Significant

5.4.3.1 Proposed Program

The proposed Program would result in significant but mitigable impacts to the following resources:

- Cultural Resources;
- Geology;
- Hazards and Hazardous Materials; and,
- Public Services.

Significant impacts on these resources from construction and operation of the proposed appealable/fill projects and land use changes under the proposed Program would be reduced to less than significant levels with implementation of mitigation measures, as described in Chapter 3.0, Environmental Analysis.
5.4.3.2 Alternative 1 – No-Program Alternative

The No-Program Alternative would result in significant but mitigable impacts to the following resources:

- Cultural Resources;
- Geology;
- Hazards and Hazardous Materials; and,
- Public Services.

The magnitude of impacts on these resources from construction and operation of the proposed appealable projects under the No-Program Alternative would be comparable to those described for the proposed Program. Significant impacts on these resources would be reduced to less than significant levels with implementation of mitigation measures, as described in Chapter 3.0, Environmental Analysis.

5.4.3.3 Alternative 2 – No Fill Alternative

The No Fill Alternative also would result in significant but mitigable impacts to the following resources:

- Cultural Resources;
- Geology;
- Hazards and Hazardous Materials; and,
- Public Services.

The magnitude of impacts on these resources from construction and operation of the proposed appealable projects under the No Fill Alternative would be comparable to those described for the proposed Program. Significant impacts on these resources would be reduced to less than significant levels with implementation of mitigation measures, as described in Chapter 3.0, Environmental Analysis.

5.4.4 Resources with Less than Significant Impacts

5.4.4.1 Proposed Program

The proposed Program would result in less than significant impacts to the following resources:

- Groundwater and Soils;
- Land Use;
- Recreation;
- Utilities; and,
5.4.4.2 Alternative 1 – No-Program Alternative

The No-Program Alternative would result in less than significant impacts to the following resources:

- Groundwater and Soils;
- Land Use;
- Recreation;
- Utilities; and,
- Water Quality, Sediments, and Oceanography.

5.4.4.3 Alternative 2 – No Fill Alternative

The No Fill Alternative would result in less than significant impacts to the following resources:

- Groundwater and Soils;
- Land Use;
- Recreation;
- Utilities; and,
- Water Quality, Sediments, and Oceanography.

5.4.5 Environmentally Superior Alternative

CEQA requires identification of the environmentally superior alternative in an EIR. There is no established methodology for comparing the alternatives or determining the environmentally superior alternative under CEQA. Therefore, the environmentally superior alternative was determined based on a ranking system that assigned numerical scores comparing the impacts under environmental resource areas for each alternative with the proposed Program. Only resources with significant and unavoidable or significant and mitigable impacts were considered. The scoring system ranged from -2 if impacts are considered to be substantially reduced when compared to the proposed Program, to +1 if impacts are considered to be somewhat greater when compared with the proposed Program. Table 5.4-2 presents the scoring system and rankings for each alternative.

Based on the above analysis, the No-Program Alternative and No Fill Alternative would have similar impacts, and both would have fewer impacts than the proposed Program. However, CEQA Guidelines Section 15126.6(e)(2) requires that in cases where the No-Program Alternative is determined to be the environmentally superior alternative, another alternative must be identified as environmentally superior. Consequently, the No Fill Alternative would be the environmentally superior alternative because it would have less activity than the proposed Program.

</tbody>
</table>

Notes:
- Only environmental resources with unavoidable significant impacts or significant but mitigable impacts are included in this table and the analysis used to rank alternatives; the analysis includes project-level impacts, not cumulative effects.
- -2 = Impact considered to be substantially less when compared with the proposed Program
- -1 = Impact considered to be somewhat less when compared with the proposed Program
- 0 = Impacts to be equal to the proposed Program
- 1 = Impact to be somewhat greater when compared with the proposed Program
- 2 = Impact to be substantially greater when compared with the proposed Program
- Where significant unavoidable impacts would occur across different alternatives, but there are impact intensity differences between alternatives, numeric differences are used to differentiate (i.e., in some cases, there are differences at the individual impact level, such as differences in the number of impacts or relative intensity).
