ENVIRONMENTAL JUSTICE

5.1 Introduction

The environmental justice analysis complies with Executive Order 12898, Federal Actions To Address Environmental Justice in Minority Populations and Low-Income Populations, which requires federal agencies to assess the potential for their actions to have disproportionately high and adverse environmental and health impacts on minority and low-income populations, and with the Council on Environmental Quality (CEQ) Guidance for Environmental Justice Under NEPA (CEQ 1997). This assessment is also consistent with California state law regarding environmental justice.

After implementation of mitigation measures, the proposed Project would result in disproportionate effects on minority and low-income populations as a result of significant project and cumulative impacts related to air quality, noise, recreation, and risk of upset.

5.1.1 Background

The Environmental Justice (EJ) section of this Draft Supplemental Environmental Impact Statement/Subsequent Environmental Impact Report (SEIS/SEIR) evaluates whether the proposed Project and its alternatives would result in disproportionately high and adverse human health or environmental impacts on minority populations and low-income populations.

The following topics are discussed in this section:

- Environmental setting including minority populations and low-income populations in the study area (using data from the 2000 U.S. Census);
- Applicable EJ statutes, executive orders, and regulatory guidance;
• Public outreach process and use of Spanish translation to provide access to Project information and opportunities for public participation by potentially affected minority and low-income communities;

• Impacts and mitigations including any high and adverse (i.e., significant) impacts identified in Sections 3.1 through 3.15 of the SEIS/SEIR, and whether these impacts would disproportionately affect minority populations and low-income populations;

• Mitigation measures for disproportionate impacts, if needed; and

• Cumulative impacts, as applicable, when the proposed Project’s impacts are added to disproportionate impacts of other actions and activities in the area.

5.1.2 Relationship to 1992 Deep Draft FEIS/FEIR

The 1992 Deep Draft FEIS/FEIR (USACE and LAHD 1992) predates the adoption of Executive Order 12898 and actions taken by state and local agencies and jurisdictions to incorporate considerations of EJ into environmental analysis and planning. Therefore, the Deep Draft FEIS/FEIR does not include an analysis of EJ, and the EJ analysis presented below does not directly tier from any existing analysis. This Draft SEIS/SEIR does, however, address cumulative environmental justice effects by evaluating the effects of the proposed Project and alternatives in combination with past, present and reasonably foreseeable future projects. This is done by evaluating significant cumulative impacts identified in Chapter 4.

5.2 Environmental Setting

The Marine Terminal and storage tanks would be located in the Port of Los Angeles (Port) and adjacent to two City of Los Angeles communities: Wilmington (to the north) and San Pedro (to the west). Portions of the pipeline route, and the termini of the new pipelines at the Ultramar/Valero Refinery and connections into other Plains pipeline systems, would extend outside of Port-controlled property. Most of the portions outside the Port would be within property owned by the Ultramar/Valero refinery or within road or railway rights-of-way in the City of Los Angeles; a small portion would be within the City of Long Beach.

For this assessment, the area of potential effect was determined in accordance with CEQ (1997) guidance for identifying the “affected community,” which requires consideration of the nature of likely project impacts and identification of a corresponding unit of geographic analysis. Therefore, the area of potential project effect for purposes of environmental justice corresponds to the areas of effect associated with the specific environmental issues analyzed in this Draft SEIS/SEIR. Areas of potential effect differ somewhat for each environmental issue.

Environmental justice guidance from CEQ (1997) defines “minority persons” as “individuals who are members of the following population groups: American Indian or Alaskan Native; Asian or Pacific Islander; Black (not of Hispanic origin); or Hispanic” (CEQ 1997, page 25). Hispanic or Latino refers to an ethnicity whereas American Indian, Alaskan Native, Asian, Pacific Islander, and Black/African-
American (as well as White or European-American) refer to racial categories; thus, for Census purposes, individuals classify themselves into racial categories as well as ethnic categories, where ethnic categories include Hispanic/Latino and non-Hispanic/Latino. The 2000 Census allowed individuals to choose more than one race. For this analysis, consistent with guidance from the CEQ as well as the U.S. Environmental Protection Agency (USEPA) (CEQ 1997; USEPA 1998, 1999), “minority” refers to people who are Hispanic/Latino of any race, as well as those who are non-Hispanic/Latino of a race other than White or European-American.

The same CEQ environmental justice guidance (CEQ 1997) suggests low-income populations be identified using the national poverty thresholds from the Census Bureau; guidance from USEPA (1998, 1999) also suggests using other regional low-income definitions as appropriate. Due to the higher cost of living in southern California compared to the nation as a whole, a higher threshold is appropriate for the identification of low-income populations. For the purposes of this analysis, low-income people are those with a household income of up to 1.25 times the national Census poverty threshold. The 1.25 ratio is based on application of a methodology developed by the National Academy of Sciences (Citro and Michael 1995) and incorporates detailed data about fair market rents, over the period 1999-2007, for Los Angeles County from the U.S. Department of Housing and Urban Development (HUD 2007). Appendix T.1 contains a detailed description of the method used to derive the low-income definition.

To establish context for this environmental justice analysis, race and ethnicity (i.e., minority) and income characteristics of the population residing in the vicinity of the proposed Project, Reduced Project Alternative, and No Federal Action/No Project Alternative were reviewed. Table 5-1 presents population, minority, and low-income status from the 2000 Census and the Los Angeles City Planning Department for Wilmington, San Pedro, Long Beach, Los Angeles County and the City of Los Angeles, and California. The table also presents similar data for other cities in the general vicinity of the Port.

Sources: U.S. Census Bureau, 2000; Los Angeles Department of City Planning, 2005 (data for Wilmington and San Pedro, which are defined based on Community Plan Areas).
Table 5-1 shows that within Wilmington (as the neighborhood is defined by the Los Angeles Planning Department), minorities constitute 87.1 percent of the population and low-income persons constitute 32.2 percent of the population. Within San Pedro, minorities comprise 55.3 percent of the population and 22.5 percent of the population is low-income. Within the City of Long Beach, minorities comprise 66.9 percent of the population and 29.8 percent of the population is low-income. Thus, both Los Angeles neighborhoods as well as the City of Long Beach, constitute a “minority population concentration” under CEQ guidance because the guidance indicates such a concentration exists if the percent minority exceeds 50 percent. Both Wilmington and Long Beach have a low-income population concentration, but San Pedro does not, compared to Los Angeles County.

Figure 5-1 shows the percentage of minority residents in Census block groups near the proposed Project site and the alternative sites. The latter are represented by the three existing liquid bulk terminals in the San Pedro Bay Ports for which growth in throughput is anticipated because there is existing unused capacity. Figure 5-2 illustrates the percentage of low-income residents in the same area. (The figures show block groups within the area modeled in the air quality dispersion and health risk analysis, which represents an approximate outer boundary of the area within which significant and unavoidable impacts may conceivably occur; however, note that the effects analysis does not, in fact, find significant and unavoidable impacts over the entire area of analysis, as described in Section 3.2 and later in this chapter.) Table 5-2 presents data for the 110 Census tracts shown in Figures 5-1 and 5-2. Table T.2-1 in Appendix T.2 provides data for the 314 block groups shown in Figures 5-1 and 5-2.

5.3 Applicable Regulations

5.3.1 Executive Order 12898: Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations

In 1994, in response to growing concern that minority and/or low-income populations bear a disproportionate amount of adverse health and environmental effects,

President Clinton issued Executive Order 12898 on Environmental Justice, formally focusing federal agency attention on these issues. The Executive Order contains a general directive that states that “each Federal agency shall make achieving environmental justice part of its mission by identifying and addressing, as appropriate, disproportionately high and adverse human health or environmental effects of its programs, policies, and activities on minority populations and low-income populations.”

The Executive Order authorized the creation of an Interagency Working Group (IWG) on Environmental Justice, overseen by the USEPA, to implement the Executive Order’s requirements. The IWG includes representatives of a number of executive agencies and offices and has developed guidance for terms contained in the Executive Order.

The USEPA defines “environmental justice” as follows:

The fair treatment and meaningful involvement of all people regardless of race, color, national origin, or income with respect to the development, implementation, and enforcement of environmental laws, regulations, and policies.

The USEPA defines “fair treatment” as follows:

No group of people, including a racial, ethnic, or a socioeconomic group, should bear a disproportionate share of the negative environmental consequences resulting from industrial, municipal, and commercial operations or the execution of federal, state, local, and tribal programs and policies.

The USEPA defines “meaningful involvement” as follows:

1. Potentially affected community residents have an appropriate opportunity to participate in decisions about a proposed activity that will affect their environment and/or health;
2. The public’s contribution can influence the regulatory agency’s decision;
3. The concerns of all participants involved will be considered in the decision making process; and
4. The decision makers seek out and facilitate the involvement of those potentially affected.

Finally, the USEPA defines “disproportionately high and adverse effect” (or “impact”) as follows:

An adverse effect or impact that: (1) is predominately borne by any segment of the population, including, for example, a minority population and/or a low-income population; or (2) will be suffered by a minority population and/or low-income population and is appreciably more severe or greater in magnitude than the adverse effect or impact that will be suffered by a non-minority population and/or non-low-income population.
In the Presidential Memorandum to departments and agencies that accompanies Executive Order 12898, the President cites the importance of the National Environmental Policy Act (NEPA) in identifying and addressing environmental justice concerns. The memorandum states that “each Federal agency shall analyze the environmental effects, including human health, economic and social effects, of Federal actions, including effects on minority communities and low-income communities, when such analysis is required by NEPA.” The memorandum emphasizes the importance of NEPA’s public participation process, directing that “each Federal agency shall provide opportunities for community input in the NEPA process.” Agencies are directed to identify potential impacts and mitigations in consultation with affected communities and ensure the accessibility of meetings, crucial documents, and notices.”

The Presidential memorandum identifies four provisions that identify ways agencies should consider environmental justice under NEPA, as follows:

1. Each federal agency should analyze the environmental effects, including human health, economic, and social effects of federal actions, including effects on minority populations, low-income populations, and Indian tribes, when such analysis is required by NEPA.

2. Mitigation measures identified as part of an environmental assessment (EA), a finding of no significant impact (FONSI), an EIS, or a record of decision (ROD) should, whenever feasible, address significant and adverse environmental effects of proposed federal actions on minority populations, low-income populations, and Indian tribes.

3. Each federal agency must provide opportunities for effective community participation in the NEPA process, including identifying potential effects and mitigation measures in consultation with affected communities and improving the accessibility of public meetings, crucial documents, and notices.

4. Review of NEPA compliance (such as USEPA’s review under Section 309 of the Clean Air Act) must ensure that the lead agency preparing NEPA analyses and documentation has appropriately analyzed environmental effects on minority populations, low-income populations, or Indian tribes, including human health, social, and economic effects.

### 5.3.2 Council on Environmental Quality: Environmental Justice - Guidance under the National Environmental Policy Act

While the USEPA has lead responsibility for implementation of Executive Order 12898 as chair of the IWG on Environmental Justice, the CEQ has oversight of the federal government’s compliance with this Executive Order and NEPA. CEQ, in consultation with the USEPA and other agencies, has prepared guidance to assist federal agencies in NEPA compliance in its Environmental Justice—Guidance under the National Environmental Policy Act (1997). This guidance provides an overview
of Executive Order 12898; summarizes its relationship to NEPA; recommends methods for the integration of environmental justice into NEPA compliance; and incorporates as an appendix the IWG’s definitions of key terms and concepts contained in the Executive Order.

Agencies are permitted to supplement CEQ’s guidance with their own, more specific guidance tailored to their programs or activities or departments, insofar as is permitted by law.

Neither the Executive Order nor CEQ prescribe a specific format for environmental justice assessments in the context of NEPA documents. However, CEQ (1997) identifies the following six general principles intended to guide the integration of environmental justice assessment into NEPA compliance, and which are applicable to the proposed Project:

1. Agencies should consider the composition of the affected area, to determine whether minority populations, low-income populations, or Indian tribes are present in the area affected by the proposed action and, if so, whether there may be disproportionately high and adverse human health or environmental effects on minority populations, low-income populations, or Indian tribes.

2. Agencies should consider relevant public health data and industry data concerning the potential for multiple or cumulative exposure to human health or environmental hazards in the affected population and historical patterns of exposure to environmental hazards, to the extent such information is reasonably available. For example, data may suggest there are disproportionately high and adverse human health or environmental effects on a minority population, low-income population, or Indian tribe from the agency action. Agencies should consider these multiple, or cumulative effects, even if certain effects are not within the control or subject to the discretion of the agency proposing the action.

3. Agencies should recognize the interrelated cultural, social, occupational, historical, or economic factors that may amplify the natural and physical environmental effects of the agency’s proposed action. These factors should include the physical sensitivity of the community or population to particular impacts; the effect of any disruption on the community structure associated with the proposed action; and the nature and degree of impact on the physical and social structure of the community.

4. Agencies should develop effective public participation strategies. Agencies should, as appropriate, acknowledge and seek to overcome linguistic, cultural, institutional, geographic, and other barriers to meaningful participation, and should incorporate active outreach to affected groups.

5. Agencies should assure meaningful community representation in the process. Agencies should be aware of the diverse constituencies within any particular community when they seek community representation and should endeavor to have complete representation of the community as a whole. Agencies also should be aware that community participation must occur as early as possible if it is to be meaningful.
Environmental Justice

6. Agencies should seek tribal representation in the process in a manner that is consistent with the government-to-government relationship between the United States and tribal governments, the federal government’s trust responsibility to federally-recognized tribes, and any treaty rights.

CEQ (1997) states that the identification of a disproportionately high and adverse human health or environmental effect on a low-income or minority population does not preclude a proposed agency action from going forward or compel a finding that a proposed project is environmentally unacceptable. Instead, the identification of such effects is expected to encourage agency consideration of alternatives, mitigation measures, and preferences expressed by the affected community or population.

5.3.3 California Government Code Sections 65041-65049; Public Resources Code Sections 71110-71116

Environmental justice is defined by California state law as “the fair treatment of people of all races, cultures, and incomes with respect to the development, adoption, implementation, and enforcement of environmental laws, regulations, and policies.”

The California Public Resources Code Section 71113 states that the mission of the Cal/EPA includes ensuring that it conducts any activities that substantially affect human health or the environment in a manner that ensures the fair treatment of people of all races, cultures, and income levels, including minority populations and low-income populations of the state.

As part of its mission, Cal/EPA was required to develop a model environmental justice mission statement for its boards, departments, and offices. Cal/EPA was tasked to develop a Working Group on Environmental Justice to assist it in identifying any policy gaps or obstacles impeding the achievement of environmental justice. An advisory committee including representatives of numerous state agencies was established to assist the Working Group pursuant to the development of a Cal/EPA intra-agency strategy for addressing environmental justice. The California Public Resources Code Sections 71110-71116 charges the Cal/EPA with the following responsibilities:

- Conduct programs, policies, and activities that substantially affect human health or the environment in a manner that ensures the fair treatment of people of all races, cultures, and income levels, including minority populations and low-income populations of the state.

- Promote enforcement of all health and environmental statutes within Cal/EPA’s jurisdiction in a manner that ensures the fair treatment of people of all races, cultures, and income levels, including minority populations and low-income populations of the state.

- Ensure greater public participation in the agency’s development, adoption, and implementation of environmental regulations and policies.
• Improve research and data collection for programs within the agency relating to the health and environment of minority populations and low-income populations of the state.

• Coordinate efforts and share information with the USEPA.

• Identify differential patterns of consumption of natural resources among people of different socio-economic classifications for programs within the agency.

• Consult with and review any information received from the IWG pursuant to developing an agency-wide strategy for Cal/EPA.

• Develop a model environmental justice mission statement for Cal/EPA’s boards, departments, and offices.

• Consult with, review, and evaluate any information received from the IWG pursuant to the development of its model environmental justice mission statement.

• Develop an agency-wide strategy to identify and address any gaps in existing programs, policies, or activities that may impede the achievement of environmental justice.

California Government Code Sections 65040-65040.12 identify the Governor’s Office of Planning and Research (OPR) as the comprehensive state agency responsible for long-range planning and development. Among its responsibilities, the OPR is tasked with serving as the coordinating agency in state government for environmental justice issues. Specifically, the OPR is required to consult with the Cal/EPA, state Resources Agency, the Working Group on Environmental Justice, and other state agencies as appropriate, and share information with the CEQ, USEPA, and other federal agencies as appropriate to ensure consistency.

Cal/EPA released its final Intra-Agency Environmental Justice Strategy in August 2004. The document sets forth the agency’s broad vision for integrating environmental justice into the programs, policies, and activities of its departments. It contains a series of goals, including the integration of environmental justice into the development, adoption, implementation, and enforcement of environmental laws, regulations, and policies.

5.3.4 California State Lands Commission Environmental Justice Policy

The California State Lands Commission (CSLC) adopted an Environmental Justice Policy on October 1, 2002 (CSLC 2002). In its policy, the CSLC pledges to continue and enhance its processes, decisions, and programs with environmental justice as an essential consideration by, among other actions, “identifying relevant populations that might be adversely affected by commission programs or by projects submitted by outside parties for its consideration”. The policy also cites the definition of environmental justice in state law and points out that this definition is consistent with the Public Trust Doctrine principle that the management of trust lands is for the benefit of all of the people. To date, the CSLC has not issued any guidance to
implement the policy, although environmental justice is addressed in CSLC environmental documents.

### 5.3.4 City of Los Angeles General Plan

The City of Los Angeles General Plan has adopted environmental justice policies as outlined in the Framework Element and the Transportation Element; these policies are summarized below. The Framework Element is a “strategy for long-term growth which sets a citywide context to guide the update of the community plan and citywide elements.”

The Framework Element includes a policy to “assure the fair treatment of people of all races, cultures, incomes and education levels with respect to the development, implementation and enforcement of environmental laws, regulations and policies, including affirmative efforts to inform and involve environmental groups, especially environmental justice groups, in early planning stages through notification and two-way communication.”

The Transportation Element includes a policy to “assure the fair and equitable treatment of people of all races, cultures, incomes and education levels with respect to the development and implementation of citywide transportation policies and programs, including affirmative efforts to inform and involve environmental groups, especially environmental justice groups, in the planning and monitoring process through notification and two-way communication.”

The City of Los Angeles also has committed to a Compact for Environmental Justice, which was adopted by the City’s Environmental Affairs Department as the city’s foundation for a sustainable urban environment. Statements relevant to the Project include the following:

- All people in Los Angeles are entitled to equal access to public open space and recreation, clean water, and uncontaminated neighborhoods.
- All planning and regulatory processes must involve residents and community representatives in decision making from start to finish.

### 5.3.6 South Coast Air Quality Management District: Environmental Justice Program

In 1997, the SCAQMD adopted a set of guiding principles on environmental justice, addressing the rights of area citizens to clean air, the expectation of government safeguards for public health, and access to scientific findings concerning public health. Subsequent follow-up plans and initiatives led to the SCAQMD Board’s approval in 2003-04 of an Environmental Justice Workplan (Workplan). SCAQMD intends to update its Workplan as needed to reflect ongoing and new initiatives.

SCAQMD’s environmental justice program is intended to “ensure that everyone has the right to equal protection from air pollution and fair access to the decision making
Environmental justice is defined by SCAQMD as “…equitable environmental policymaking and enforcement to protect the health of all residents, regardless of age, culture, ethnicity, gender, race, socioeconomic status, or geographic location, from the health effects of air pollution.”

5.4 Assessment

5.4.1 Methodology

The following methodology and assessment addresses the potential for the proposed Project and alternatives to cause disproportionately high and adverse human health and environmental effects on low-income and minority populations. It is provided in compliance with federal Executive Order 12898 and CEQ’s *Environmental Justice Guidance Under the National Environmental Policy Act* (CEQ 1997). Although the California Environmental Quality Act (CEQA) does not specifically require analysis of environmental justice effects, this Draft SEIS/SEIR includes an environmental justice analysis for both federal and non-federal actions associated with the proposed Project and alternatives.

The methodology for conducting the impact analysis for environmental justice included reviewing impact conclusions for each of the resources in Sections 3.1 through 3.15, as well as the cumulative analysis in Sections 4.2.1 through 4.2.15. If the Draft SEIS/SEIR identified significant impacts or a cumulatively considerable contribution to a cumulatively significant impact, or otherwise identified impacts considered to be high and adverse, an evaluation was conducted to determine if these impacts would result in disproportionately high and adverse effects on minority populations or low-income populations.

The *L.A. CEQA Thresholds Guide* (City of Los Angeles 2006) does not identify significance thresholds for environmental justice or for disproportionately high and adverse effects on minority and low-income populations. In the absence of local thresholds and because a joint SEIS/SEIR is being prepared for the proposed Project, federal guidance provided by CEQ has been utilized as the basis for determining whether the proposed Project would result in environmental justice effects. CEQ has oversight of the federal government’s compliance with Executive Order 12898 and NEPA and has published *Environmental Justice Guidance Under the National Environmental Policy Act* (CEQ 1997). The CEQ guidance identifies three factors to be considered to the extent practicable when determining whether environmental effects are disproportionately high and adverse (CEQ, 1997, pp. 25-26):

- Whether there is or would be an impact on the natural or physical environment that significantly (as employed by NEPA) and adversely affects a minority population, low-income population, or Indian tribe. Such effects may include ecological, cultural, human health, economic, or social impacts on minority communities, low-income communities, or Indian tribes when those impacts are interrelated to impacts on the natural or physical environment;
• Whether the environmental effects are significant (as employed by NEPA) and are or may be having an adverse impact on minority populations, low-income populations, or Indian tribes that appreciably exceeds or is likely to appreciably exceed those on the general population or other appropriate comparison group; and

• Whether the environmental effects occur or would occur in a minority population, low-income population or Indian tribe affected by cumulative or multiple adverse exposures from environmental hazards.

Findings for project-level impacts and the contribution of the proposed Project to cumulative impacts were reviewed to determine which impacts were significant, or represented cumulatively considerable contributions to cumulatively significant impacts, and would therefore require environmental justice analysis.

• For impacts that were less than significant and also less than cumulatively considerable, or classified as “No Impact” (and therefore also not cumulatively considerable), further evaluation of the potential for disproportionately high and adverse effects on minority and low-income populations was not needed because impacts that would not be significant would not have the potential to result in such disproportionate effects.

• Findings of significant impacts or cumulatively considerable contributions to cumulatively significant impacts were reviewed to determine whether those impacts could cause substantial effects on human populations (i.e., the public), as opposed to primarily affecting the natural or physical environment and/or resulting in limited public exposure. Significant impacts that would not be associated with substantial effects on human populations would not result in disproportionately high and adverse effects on minority and low-income populations. However, for disclosure purposes, these significant impacts are summarized in order to facilitate public involvement and review by potentially affected minority and low-income populations in the vicinity of the project.

• For findings of significant impacts that would affect the public, mitigation measures were considered to determine whether adverse effects would still be significant (as defined by NEPA and CEQA) after mitigation measures are implemented. If the impact would be less than significant after mitigation – or, in the case of a cumulative contribution, if the contribution would be less than cumulatively considerable after mitigation – then the impact was documented for disclosure purposes, but detailed analysis to determine if the impact or contribution would occur disproportionately on low-income and/or minority populations was not done.

• If the impact would be significant and unavoidable – or the contribution to cumulative impacts would be cumulatively considerable and unavoidable – then the impact was further evaluated to determine whether it would result in disproportionately high and adverse human health or environmental effects on minority and low-income populations. If the specific location of the impact was identified, the population demographics of the affected area were estimated using data from the 2000 Census. In cases where the boundaries of the impacted area were not known, conclusions were drawn based on available
information. In cases where data limitations did not allow a full evaluation, this fact was identified.

- In cases where the minority and low-income characteristics of populations in the impacted area could be estimated, the impact area characteristics were compared to data for the general population (i.e., Los Angeles County). If the minority population in the adversely affected area is greater than 50 percent or if either the minority percentage or the low-income percentage of the population in the adversely affected area is meaningfully greater than that of the general population, disproportionate effects on minority or low-income populations could occur. (“Meaningfully greater” is not defined in CEQ or USEPA guidance; for this analysis, “meaningfully greater” is interpreted to mean simply “greater,” which provides for a conservative analysis.) In addition, disproportionate effects could also occur in cases where impacts are predominantly borne by minority or low-income populations.

- Proposed Project benefits were also considered to determine whether adverse effects would still be appreciably more severe or of greater magnitude after these other elements are considered. In addition, if significant unavoidable impacts or contributions to cumulatively significant impacts were determined to be disproportionate, the identified mitigation measures were reviewed to determine whether they would be effective in avoiding or reducing the impacts on minority and low-income populations. If necessary, additional mitigations were considered.

The first portion of Section 5.4.2 addresses public comments concerning environmental justice. That discussion is followed by the analysis of environmental justice for the proposed Project and cumulative effects, then the No Federal Action/No Project Alternative, followed by the Reduced Project Alternative.

### 5.4.2 Proposed Project and Cumulative Effects

Public comments received as part of the public involvement process for the Draft SEIS/SEIR identified several concerns related to environmental justice. Those concerns are addressed below. Cross-references to this and other resource sections are provided, as needed, where additional analysis of these concerns is presented in the Draft SEIS/SEIR.

**Adverse effects from blight.** Section 3.8 addresses the potential for effects on neighborhoods that relate to changes in land use, and Section 4.2.8 addresses cumulative effects and the proposed Project’s contribution. The proposed Project would have less than significant effects on land use, including Impact LU-1 and Impact LU-2 that address consistency with plans and Impact LU-3 that addresses conflicts with surrounding land uses. The proposed Project would cause less than significant impacts and would make a less than cumulatively considerable contribution to cumulative impacts on land use and, therefore, would not result in disproportionate effects.

**Identification of costs and funding for health impacts.** The SEIS/SEIR addresses health risk in Section 3.2 as part of the Air Quality analysis. Health risks are
evaluated including cancer and non-cancer risks resulting from air pollution including, for example, toxic pollutants associated with diesel emissions. In cases where significant impacts have been identified for health risk, the SEIS/SEIR includes analysis of a combination of mitigations determined to be feasible in reducing the volume of emissions that cause the increase in health risk. For example, Mitigation Measure (MM) AQ-13 (expanded vessel speed reduction program), MM AQ-14 (low sulfur fuel use), MM AQ-15 (Alternative Maritime Power or AMP), and other mitigations identified in Section 3.2 would reduce cancer risk compared to impacts of the proposed Project without such mitigations included. The Port focuses its mitigation efforts on the cause of the health risk by reducing emissions.

Identification of adversely affected populations. As required by Executive Order 12898, disproportionately high and adverse human health and environmental effects on minority and low-income populations are identified in the environmental justice analysis. These populations include individuals with increased sensitivity to health impacts such as children and the elderly, and although these groups are not discussed separately, the Health Risk Assessment evaluates sensitive receptors such as schools, hospitals, convalescent homes and daycare centers that could be affected. Section 5.2 provides a description of minority and low-income populations in the vicinity of the proposed Project and alternatives. Sections 5.4.2 through 5.4.4 discuss specific findings regarding the significance of impacts, and for impacts that could affect the public, identifies the location of the impact and the percentage of minority populations and low-income populations affected. For significant impacts that are unavoidable, mitigations identified to reduce the particular impacts are discussed.

Existing and cumulative health impacts to nearby low-income and minority populations. Sections 5.4.2 through 5.4.4 include an analysis of environmental justice effects that considers not only the proposed Project but also impacts of existing, past, and reasonably foreseeable future projects in the area of the proposed Project (i.e., cumulative impacts). The analysis takes into consideration cumulative impacts identified for the 15 resource topics discussed in Sections 3.1-3.15 (e.g., air quality, noise, aesthetics and visual resources). With respect to existing health impacts from air emissions, the air quality analysis in Section 3.2 discusses the results of recent studies that estimate these impacts and compares risks to the CEQA Baseline and the NEPA Baseline. In addition to the mitigations identified in this Draft SEIS/SEIR, the Port is implementing a variety of Port-wide measures included in the San Pedro Bay Ports Clean Air Action Plan (CAAP) that will, by reducing air emissions, help to address the underlying causes of these health impacts. Under CEQA and NEPA, the proposed Project would not result in significant unavoidable health risks but would contribute to cumulative impacts.

Public involvement. In addition to the English and Spanish mailings that the Port sends to the public (e.g., the use of postcards identified in the comment) the Port provides translators at public hearings and produces both Spanish and English versions of the Executive Summary for the Draft SEIS/SEIR that summarize specific impacts of the proposed Project and alternatives. This summary is available to the public, provides the kind of impact information identified in the comment, and is particularly designed to be read by the public and reviewers who would like to know about the impacts of the proposed Project and alternatives but do not want to review the full version of the Draft SEIS/SEIR and technical appendices.
5.4.2.1 Evaluation of Disproportionately High and Adverse Effects on Minority and Low-Income Populations

The proposed Project’s individual impacts are described for each resource in Chapter 3, and contributions to cumulative impacts in Chapter 4. This section provides a summary of impacts that would represent disproportionately high and adverse effects on minority and low-income populations. Section 5.4.2.2 addresses impacts that would not represent disproportionately high and adverse effects on minority and low-income populations.

Air Quality (Section 3.2 and 4.2.2)

The region of analysis for air quality impacts is identified in Section 3.2.2 and Table 3.2-66 summarizes air quality impacts.

AQ-2: Proposed Project construction would result in off-site ambient concentrations of criteria air pollutants – specifically, the 1-hour and annual concentration of nitrogen dioxide (NO₂), the 24-hour concentration of particulate matter with diameter smaller than 10 microns (PM₁₀), and the 24-hour concentration of particulate matter with diameter smaller than 2.5 microns (PM₂.₅) – that would exceed SCAQMD thresholds of significance, even after implementation of MM AQ-1 through MM AQ-12 and MM 4G-5. This finding applies to the individual Project impacts as well as the proposed Project’s cumulative contribution, and is true relative to both the CEQA and NEPA Baselines. Since residential areas closest to the construction sites are primarily in Wilmington and have a concentration of minority populations (greater than 50 percent) and low-income population percentage greater than Los Angeles County (Figure 5-2), the elevated ambient concentrations of NO₂, PM₂.₅, and PM₁₀ would constitute a disproportionately high and adverse effect on minority and low-income populations.

Adverse human health effects of NO₂ include (a) potential to aggravate chronic respiratory disease and respiratory symptoms in sensitive groups and (b) risk to public health implied by pulmonary and extra-pulmonary biochemical and cellular changes and pulmonary structural changes. NO₂ also contributes to atmospheric discoloration, although this impact would be regional and would not primarily affect populations closest to the emission sources. Adverse human health effects of PM₁₀ and PM₂.₅ include (a) excess deaths from short-term and long-term exposures; (b) excess seasonal declines in pulmonary function, especially in children; (c) asthma exacerbation and possibly induction; (d) adverse birth outcomes including low birth weight; (e) increased infant mortality; (f) increased respiratory symptoms in children such as cough and bronchitis; and (g) increased hospitalization for cardiovascular and respiratory disease (including asthma). These adverse health effects may occur disproportionately among minority and low-income populations in the vicinity of the proposed Project as a result of the elevated ambient concentrations in exceedance of SCAQMD thresholds. No mitigation beyond the proposed air quality mitigations identified above is proposed.

AQ-4: Proposed Project operations would result in offsite ambient air pollutant concentrations of criteria air pollutants that exceed a SCAQMD threshold of
significance, even after implementation of MM AQ-13 through MM AQ-21. Specifically, the mitigated proposed Project would result in offsite exceedances of SCAQMD thresholds for annual concentrations of NO\textsubscript{2}. This is true for the proposed Project’s individual impact and cumulative contribution for both the CEQA and NEPA Baselines. While implementation of mitigation measures would reduce the impact of the proposed Project, the impact would remain significant after mitigation.

Since residential areas in San Pedro are closest to the primary source of the NO\textsubscript{2} emissions, which are caused by ships, and San Pedro has a concentration of minority populations (Figure 5-1), the elevated ambient concentrations of NO\textsubscript{2} would constitute a disproportionately high and adverse effect on minority populations. Potential human health effects from NO\textsubscript{2} would be the same as described immediately above under AQ-2. No mitigation beyond the proposed air quality mitigations identified above is proposed.

AQ-5: The proposed Project would create less than significant odor impacts under CEQA and NEPA. However, the proposed Project would make a cumulatively considerable contribution to cumulatively significant odor impacts (Section 4.2.2.6). Because the impacts would occur in the vicinity of the Port, which includes a predominantly minority population and a low-income population concentration, the proposed Project’s contribution to Cumulative Impact AQ-5 would constitute a disproportionately high and adverse effect on minority and low-income populations. No additional mitigations are proposed for environmental justice.

AQ-6: The Project alone would result in a less than significant impact for cancer, acute non-cancer, and chronic non-cancer effects under CEQA and NEPA with mitigations MM AQ-1 through MM AQ-21 and MM 4G-5 included. However, increases in toxic emissions (also referred to as toxic air contaminants or TACs) from construction and operations of the proposed Project would result in a cumulatively considerable contribution to cumulatively significant impacts for cancer, acute non-cancer, and chronic non-cancer risks at residential and other sensitive receptors under CEQA. Under NEPA, proposed Project emissions of TACs, with mitigations, would result in a cumulatively considerable contribution to cumulatively significant chronic non-cancer risks at sensitive receptors (Section 4.2.2.7). Because the impacts would occur in the vicinity of the Port, which includes a predominantly minority population and a low-income population concentration, the proposed Project’s contribution to Cumulative Impact AQ-6 would constitute a disproportionately high and adverse effect on minority populations and low-income populations. (Note that Figures 3.2-2 and 3.2-4, respectively, illustrate cancer risk when mitigations are included, for the proposed Project under CEQA and NEPA). No mitigation beyond the proposed air quality mitigations identified above is proposed.

It should be noted that port-wide air quality mitigations that will be implemented through the Port’s CAAP and measures implemented as part of this project will reduce the health risk impacts from the proposed Project and other projects at the Port. Future rulemaking activities by the CARB and USEPA also will reduce future cumulative health impacts. Other than a few CAAP measures, these future measures have not been accounted for in the emission calculations or health risk assessment for the proposed Project. Therefore, the extent to which these future measures will reduce cumulative health risk impacts within the Port project area is unknown at this time.
Noise (Section 3.10 and Section 4.2.10)

The region of influence for noise impacts is identified in Section 3.10.2 and Table 3.10-14 summarizes noise impacts.

NOI-1: Construction activities lasting more than 10 days in a 3-month period would exceed existing ambient exterior noise levels by 5 dB(A) or more at a noise-sensitive use. The proposed Project would produce significant unavoidable construction noise impacts under both CEQA and NEPA at three sensitive receptors: Area 1 Berth 204, Area 2 Lighthouse Yacht Landing, and Area LR-2 (Reservation Point) (see Figure 3.10-1 for locations). Despite the application of MM NOISE-1 (selection of contractor for pile driving with consideration of noise), MM NOISE-2 (restricted hours for pile driving), MM NOISE-3 (temporary noise attenuation barriers), and MM 4H-1 through MM 4H-3, construction activities at each of these locations would cause temporary and periodic noise levels substantially above existing ambient noise levels in the area.

Area 1 (Berth 204) and Area 2 (Lighthouse Yacht Landing) are marinas with live-aboard slips in Wilmington (see Figure 3.10-1). Pipeline construction is projected to cause a 7 dB(A) increase in noise levels at both Berth 204 and Lighthouse Yacht Landing. These noise impacts would be temporary, but significant.

Areas 1 and 2 are located in Census tract 2947, block group 3. The minority percentage for this block group is 52.6 percent which is higher than 50 percent. The low-income percentage for the block group is 12.8 percent, which would be lower than Los Angeles County. Thus, there would be disproportionate effects on minority populations from significant unavoidable noise impacts during construction at Area 1 Berth 204 and Area 2 Lighthouse Yacht Landing. The project would make a cumulatively considerable contribution to a significant cumulative impact, due to construction period noise impacts from the project as well as construction in other locations identified in Section 4.2.10. Like the Project-specific impacts, these significant cumulative impacts would disproportionately affect minority populations.

Area LR-2 is located on the southeastern-most tip of Reservation Point (see Figure 3.10-1) approximately 0.5 mile (0.8 km) northwest of Pier 400 and contains housing for prison wardens and naval officers. Construction would result in a temporary 11 dB(A) increase in noise levels over existing conditions. This area is located within Census Tract 2961, block group 2. The minority percentage for this block group is 75.4 percent, which is higher than 50 percent and also higher than Los Angeles County. The U.S. Census does not report poverty data for this block group. Census Tract 2961, a larger area, is 31 percent low-income. Based on the minority percentage for the Census block group, there would be disproportionate effects on minority populations from significant unavoidable noise impacts during construction at Area LR-2 on Reservation Point. The project would make a cumulatively considerable contribution to a significant cumulative impact, due to construction period noise impacts from the project as well as construction in other locations identified in Section 4.2.10. Like the Project-specific impacts, these significant cumulative impacts would disproportionately affect minority populations. No mitigation beyond the proposed noise mitigations identified above is proposed.
Recreation (Section 3.11 and Section 4.2.11)

The region of influence for recreation impacts is identified in Section 3.11.2 and Table 3.11-10 summarizes recreation impacts.

**REC-1.1:** The proposed Project would produce significant unavoidable recreation impacts due to construction noise under CEQA and NEPA at four recreation areas, including marinas at Area 1 Berth 204 and Area 2 Lighthouse Yacht Landing, Area LR-2 Reservation Point, which was used as the receptor location representing noise conditions in the harbor for recreational boaters, and Area 21 (Stephen White Street and Oliver Vickery Circle Way), which was used as the receptor location representing noise conditions at Cabrillo Beach (see Figure 3.10-1 for locations). Despite the application of **MM 4K-4** (boating safety measures during in-water construction), **MM NOISE-1** (selection of contractor for pile driving with consideration of noise), and **MM NOISE-2** (restricted hours for pile driving), construction activities at each of these locations would cause temporary and periodic noise levels that could be perceived as annoying to individuals during recreation activities and would be significant and unavoidable for the proposed Project and represent a cumulatively considerable contribution to a significant cumulative recreation impact under CEQA and NEPA.

Areas 1 and 2 are located in Census tract 2947, block group 3. The minority percentage for this block group is 52.6 percent, which is higher than 50 percent. The low-income percentage for the block group is 12.8 percent, which would be lower than Los Angeles County. Thus, there would be disproportionate effects on minority populations from significant unavoidable recreation impacts from noise during construction at Area 1 Berth 204 and Area 2 Lighthouse Yacht Landing. The project would make a cumulatively considerable contribution to a significant cumulative recreation impact, due to construction noise from the Project as well as construction in other locations identified in Section 4.2.10. Like the Project-specific impacts, these significant cumulative impacts would disproportionately affect minority populations.

Area LR-2 is located on the southeastern-most tip of Reservation Point (see Figure 3.10-1) approximately 0.5 mile (0.8 km) northwest of Pier 400 and is used as a receptor location representing conditions for recreational boaters in Los Angeles Harbor. Conservatively assuming that residents living in closest proximity to the Port are the most frequent recreational boaters, significant unavoidable recreation impacts from construction would have disproportionate effects on minority and low-income populations. The project would make a cumulatively considerable contribution to a significant cumulative impact, due to construction period noise impacts as well as construction in other locations identified in Section 4.2.10. This significant cumulative recreation impact would result in disproportionately high and adverse effects on minority and low-income populations.

Area 21 (Stephen White Street and Oliver Vickery Circle Way) is used as a representative receptor location for Cabrillo Beach and Fishing Pier. Construction noise in the vicinity of Area 21 would be perceived as an annoyance to recreation users. Cabrillo Beach is located in Census tract 2976, block group 9, where the minority percentage is below 50 percent and the low-income percentage is below that
of Los Angeles County. However, these facilities would be used not just by those living close by. Because there is a predominantly minority population and a low-income concentration in the vicinity of the Port, as well as the fact that low-income users may rely on use of public (i.e., lower cost) recreational resources more than other users, there would be disproportionate effects on minority and low-income residents from REC-1.1 under both CEQA and NEPA, for the proposed Project. The proposed Project would also represent a cumulatively considerable contribution to a significant cumulative recreation impact. This significant cumulative recreation impact would result in disproportionately high and adverse effects on minority and low-income populations.

No mitigation beyond the proposed Project mitigations for recreation and noise described above is identified to reduce disproportionate effects listed above, resulting from REC-1.1.

REC-1.2: Proposed Project operations could result in a temporary substantial loss or diminished quality of recreational, educational, or visitor-oriented opportunities, facilities, or resources in the event of an oil spill that would result in individually significant and unavoidable impacts and make a cumulatively considerable contribution to cumulatively significant impacts under CEQA and NEPA (REC-1.2). This would be true despite implementation of MM RISK 2.1a (double-hulled vessels) and MM RISK 2.1b (quick release couplings). An accidental oil spill during vessel unloading activities at the proposed Berth 408 or related to pipeline failure could degrade harbor fisheries, thereby diminishing the quality of recreational fishing at Cabrillo Beach, as well as limiting or even precluding certain on-water boating opportunities for the duration of any cleanup effort. Oil reaching a recreational marina could coat vessels moored there and, potentially, foul cooling water intakes and other below-waterline fittings with potential adverse effects. Vessels coated with oil would need to be cleaned prior to future use. Beaches in the vicinity of an oil spill would potentially be oiled and require cleanup, which typically would preclude recreational uses during the cleanup effort. Depending on the size of spill, cleanup and the associated preclusion of recreational uses could last from several days to several weeks or months.

Cabrillo Beach and Fishing Pier are located in Census tract 2976, block group 9 where the minority percentage is below 50 percent and the low-income percentage is below that of Los Angeles County. However, these facilities would be used not just by those living close by. Because the percentages of minority and low-income populations in the vicinity of the Port are generally higher than other areas, as well as the fact that low-income users may rely on use of public (i.e., lower cost) recreational resources more than other users, there would be a disproportionate impact under both CEQA and NEPA, individually and cumulatively, on minority and low-income residents from REC-1.2. No mitigation beyond the proposed Project mitigations for described above is identified to reduce disproportionate effects resulting from REC-1.2.
Risk of Upset/Hazardous Materials (Section 3.12 and Section 4.2.12)

The region of influence for risk of upset/hazardous materials is identified in Section 3.12.2. Table 3.12-18 lists risk impacts.

RISK-5: Even with the application of all possible mitigation measures, potential residual impacts related to terrorism risk would be considered significant given the environmental and public safety consequences associated with a successful terrorist attack. Impacts of significant unavoidable Project and cumulative impacts from RISK-5 under both CEQA and NEPA would result in disproportionately high and adverse effects on minority and low-income populations because the impacts could occur in the vicinity of the Port, and depending upon the location, although affecting many individuals directly and indirectly, could have the greatest effects on populations in the vicinity of the Port which include a predominantly minority and a low-income population concentration.

5.4.2.2 Summary of Impacts that Would Not Cause Disproportionately High and Adverse Effects on Minority and Low-Income Populations

Most of the proposed Project’s impacts would not cause disproportionate effects. This section therefore discusses (1) resources with less than significant impacts that would be reduced through mitigation or would not require any mitigation because they are less than significant and would therefore not result in disproportionate effects on minority and low-income populations, and (2) significant unavoidable impacts that would nevertheless not result in disproportionate effects for various reasons. For the first category mentioned above, the less than significant impacts are not individually identified below, but are addressed in the applicable resource section; this section cross-references the individual resource sections where more information can be found. A complete list of impact findings, including significant, less than significant, and no impact findings for the 15 resource topics can be found in the summary tables at the end of each resource impact section (Sections 3.1-3.15). Cumulative impacts for each resource are described in detail in Chapter 4, and summarized in Table ES-3 under the subsection for Chapter 4 (Cumulative Impacts).

This section also provides a summary of individual and cumulative impacts that would be significant and unavoidable but would not cause disproportionately high and adverse effects on minority and low-income populations, either because the significant impact or cumulatively considerable contribution would not affect human populations or it would not have a disproportionately high and adverse effect on minority and low-income populations based on comparison of the affected population to the general population.

Aesthetics/Visual Resources (Section 3.1 and Section 4.2.1)

The region of influence for aesthetics and visual resources is identified in Section 3.1.2. Table 3.1-2 identifies aesthetics/visual resources impacts. The proposed
Project would have no impact or less than significant impacts on aesthetics/visual resources under CEQA and NEPA and would not result in a cumulatively considerable contribution to aesthetics/visual impacts; therefore it would not result in disproportionate effects on minority populations or low-income populations.

**Air Quality and Meteorology (Section 3.2 and Section 4.2.2)**

Table 3.2-66 identifies air quality and meteorology impacts.

**AQ-1:** Proposed Project construction would produce emissions that would exceed a SCAQMD emission significance threshold and would remain significant under both CEQA and NEPA following mitigation (MM AQ-1 through AQ-12 and MM 4G-5). The proposed Project would also have a cumulatively considerable contribution (with mitigation) to a cumulatively significant exceedance of the SCAQMD emission threshold, relative to both the CEQA and NEPA Baselines. However, because the impact relates to a conflict with a standard and is a mass-based threshold that is not associated with a specific location or dependent on the presence of sensitive receptors or uses, Impact AQ-1 would not constitute a disproportionate effect on minority or low income populations.

**AQ-3:** The proposed Project would result in operational emissions that exceed 10 tons per year of VOCs and other emissions would exceed a SCAQMD threshold of significance that would remain significant under CEQA and NEPA, even after implementation of MM AQ-13 through MM AQ-21. The proposed Project would also have a cumulatively considerable contribution (with mitigation) to a cumulatively significant exceedance of the SCAQMD emission threshold, relative to both the CEQA and NEPA Baselines. However, because the impact relates to a conflict with a standard based on a mass-based threshold and is not associated with a specific location or dependent on the presence of sensitive receptors or uses, Impact AQ-3 would not constitute a disproportionate effect on minority or low-income populations.

**AQ-8:** The proposed Project would result in increased emissions of greenhouse gases (GHGs). The increase would be significant and unavoidable under CEQA and would make a cumulatively considerable contribution to a cumulatively significant impact. No impact determination is made with regard to NEPA. The potential ecological damage and damage to human populations from global climate change would affect people globally, including all people in California and in the United States. Section 3.2 describes potential global impacts of GHG and identifies MM AQ-13 (vessel speed reduction program), MM AQ-15 (AMP) and other feasible mitigation measures (MM AQ-22 through MM AQ-27). These effects would have consequences for all people, and therefore would not affect minority or low-income populations disproportionately.

**Biological Resources (Section 3.3 and Section 4.2.3)**

The geographic region of analysis for biological resources differs by organism groups, because the mobility of species in these groups, their population distributions, and the normal movement range for individuals living in an area varies
so that effects on biotic communities in one area can affect communities in other nearby areas. The region of analysis is described fully in Section 4.2.3, and is not reiterated here because no biological resource impacts would contribute to disproportionately high and adverse effects on minority or low-income populations. Table 3.3-3 lists biological impacts.

BIO-1.2: As a result of the potential for accidental oil spills, operation of the proposed Project could have significant effects on the California least tern and the California brown pelican, which are special status species, resulting in a potential for significant impact (Impact BIO-1.2). This impact would be significant and unavoidable with implementation of all feasible mitigation measures and would make a cumulatively considerable contribution to a cumulative impact for both species under CEQA and NEPA. In addition, the Project’s contribution with regard to whale strikes is cumulatively considerable and the overall impact is cumulatively significant under CEQA (Cumulative Impact BIO-1). However, these impacts would primarily affect biological communities, not human populations or the public, and therefore, would not constitute a disproportionately high and adverse effect on minority or low-income populations.

BIO-2.2: Proposed Project operations, including accidental oil spills and the related impacts on eelgrass beds, have the potential to substantially reduce or alter local biological communities (Impact BIO-2.2). Operational impacts related to oil spills and impacts to eelgrass would be significant and unavoidable in the short term given the lack of feasible mitigations other than MM BIO-1.2c (oil spill containment), and would make a cumulatively considerable contribution to a cumulative significant impact. Because Impact BIO-2.2 would primarily affect biological communities, not human populations or the public, it would not constitute a disproportionately high and adverse effect on minority or low-income populations.

BIO-4.2: Proposed Project operations, including accidental oil spills and introduction of invasive species, have the potential to substantially disrupt local biological communities (Impact BIO-4.2). Potentially significant operations impacts related to oil spills and invasive species would be significant and unavoidable given the lack of feasible mitigations other than MM BIO-4, and would make a cumulatively considerable contribution to a cumulative impact. Because Impact BIO-4.2 would primarily affect biological communities, not human populations or the public, it would not constitute a disproportionately high and adverse effect on minority or low-income populations.

Cultural Resources (Section 3.4 and Section 4.2.4)

The region of influence for cultural resources is identified in Section 3.4.2. Table 3.4-1 lists cultural resource impacts, none of which would be significant and unavoidable under CEQA or NEPA, nor would the proposed Project result in a cumulative contribution to cultural resource impacts. Therefore, the proposed Project would not result in disproportionate effects on minority or low-income populations from cultural resources impacts.
Geological Resources (Section 3.5 and Section 4.2.5)

The region of influence for geological resources is identified in Section 3.5.2. Table 3.5-7 lists geological resources impacts. The impacts listed below would remain significant even with implementation of all reasonable mitigation measures.

GEO-1: Seismic activity would expose people or property to substantial risk causing significant and unavoidable project and cumulative impacts, even with MM 4A-4 (seismic design). Because these impacts would not affect the public (i.e., could affect employees on site, but not off-site residents), GEO-1 would not result in disproportionately high and adverse effects on minority or low-income populations.

GEO-2: The proposed Project could expose people or property to substantial risk of tsunamis and seiches resulting in significant and unavoidable Project and cumulative impacts under CEQA and NEPA, even with MM GEO-1 (emergency response planning). However, because impacts would not affect the public (i.e., could affect employees on site, but not off-site residents), Impact GEO-2 and the associated cumulatively considerable contribution to a cumulatively significant impact would therefore not result in disproportionately high and adverse effects on minority or low-income populations.

Ground Transportation (Section 3.6 and Section 4.2.6)

The region of influence for ground transportation is identified in Section 3.6.2. Table 3.6-11 summarizes ground transportation impacts. With implementation of feasible mitigations measures, none of the impacts of the proposed Project would be significant with regard to the proposed Project’s individual or cumulative impacts and therefore they would not result in disproportionate effects on minority populations or low-income populations.

Groundwater and Soils (Section 3.7 and Section 4.2.7)

The region of influence for groundwater and soils is identified in Section 3.7.2. Table 3.7-2 lists groundwater and soils impacts. With mitigation, the proposed Project would have either less than significant impacts or no impacts on groundwater and soils (i.e., no significant and unavoidable project impacts) and therefore would not result in disproportionate effects on minority populations or low-income populations. The proposed Project would make a cumulatively considerable contribution to one cumulatively significant impact, which is addressed below.

Cumulative Impact GW-3: Even with implementation of NPDES-mandated effluent disposal protocol, improper releases of contaminated groundwater cannot be entirely eliminated and the contribution of the Project to risk of spreading contamination. Therefore, impacts are cumulatively considerable and unavoidable under CEQA and NEPA. Proper discharge of contaminated dewatering effluent, as outlined in MM GW-2(g), aquifer cross-contamination prevention measures, as outlined in MM GW-4, and frac-out prevention measures, as outlined in MM GW-5, would reduce water quality impacts, however the Project’s contribution would remain significant and unavoidable. The proposed Project site is underlain by saline,
non-potable groundwater. Because groundwater quality impacts would not affect
potable water supplies, there would be a negligible impact to the public. Therefore,
Cumulative Impact GW-3 would not result in disproportionate impacts on minority
or low-income populations.

Risk of Upset/Hazardous Materials (Section 3.12 and Section 4.2.12)

The region of influence for impacts associated with risk of upset and hazardous
materials is identified in Section 3.12.2. Table 3.12-18 lists risk of upset/hazardous
materials impacts.

RISK-2.1: Based on the probability of accidental crude oil spills during vessel
transit and in Port waters, potential oil spill impacts are considered significant
(Impact RISK-2.1) and unavoidable under CEQA and NEPA, even with
implementation of feasible mitigation measures. The proposed Project would make a
cumulatively considerable contribution to a cumulatively significant impact related to
oil spills. However, because adverse impacts from an oil spill would primarily affect
marine resources and biological species rather than public safety, the Project and
cumulative impacts would not result in disproportionately high and adverse effects on
minority populations or low-income populations. Note that effects of oil spills on
recreation resources are addressed separately under Impact REC-1.2 in the analysis
above (and also in Section 3.11 Recreation).

RISK-2.2: Pipeline oil spills from the proposed Project, though less than significant
for the Project itself would make a considerable contribution to a significant
unavoidable cumulative impact under CEQA and NEPA (Cumulative Impact
RISK-2.2). Although there would be impacts to biological and water resources (i.e.,
marine resources) there would be no public safety hazards from an oil spill unless it
ignites (impacts from a spill and fire are addressed under Impact RISK-3.1 in
Section 3.12 and would be less than significant with mitigation). Therefore
Cumulative Impact RISK-2.2 would not result in disproportionate effects on
minority or low-income populations.

Land Use (Section 3.8 and Section 4.2.8)

The region of influence for land use is identified in Section 3.8. Table 3.8-2 lists land
use impacts. The proposed Project, under both CEQA and NEPA, would have less
than significant individual and cumulative impacts and therefore would not result in
disproportionate effects on minority populations or low-income populations.

Noise (Section 3.10 and Section 4.2.10)

The region of influence for noise is identified in Section 3.10.2. Table 3.10-14
identifies noise impacts. Except for those noise impacts listed in Section 5.4.2.1
above, noise impacts would be less than significant and would not result in
disproportionate effects on minority populations or low-income populations under
CEQA or NEPA.
Recreation (Section 3.11 and Section 4.2.11)

The region of influence for recreation impacts is described in Section 3.11.2. Table 3.11-10 lists recreation impacts. Except for those recreation impacts listed in Section 5.4.2.1, above, recreation impacts from the proposed Project would be less than significant and would not result in disproportionate effects on minority populations or low-income populations.

Ground Transportation (Section 3.6 and Section 4.2.6)

The region of influence for ground transportation effects is identified in Section 3.6.2. Table 3.6-11 lists ground transportation impacts. After implementation of all feasible mitigation measures, the proposed Project would result in less than significant impacts to ground transportation. Therefore, the proposed Project would not result in disproportionate effects on minority populations or low-income populations.

Marine Transportation (Section 3.9 and Section 4.2.9)

The region of influence for Marine Transportation is described in Section 3.9.2. Table 3.9-5 lists marine transportation impacts. Under both CEQA and NEPA, the proposed Project would have beneficial impacts, less than significant adverse impacts or no impacts and would not result in a cumulatively considerable contribution to marine transportation impacts. Therefore, the proposed Project would not result in disproportionate effects on minority populations or low-income populations for marine transportation.

Utilities and Public Services (Section 3.13 and Section 4.2.13)

The region of influence for utilities and public service impacts varies and is identified in Section 3.13.2. Table 3.13-5 lists utilities and public services impacts. None of the impacts would be individually or cumulatively significant and unavoidable and therefore would not result in disproportionate effects on minority populations or low-income populations.

Water Quality (Section 3.14 and Section 4.2.14)

The region of influence for impacts on water and sediment quality is identified in Section 3.14.2. Table 3.14-2 lists water quality impacts. With the exception of the impact listed below, none of the individual or cumulative impacts on water quality would be significant and unavoidable.

WQ-1.2: During operation of proposed Project facilities, runoff and oil spills have the potential to result in discharges which create pollution, contamination, or nuisance, or could cause regulatory standards to be violated in harbor waters (Impact WQ-1.2), a significant and unavoidable impact under CEQA and NEPA. These impacts would make a cumulatively considerable contribution to cumulative impacts but would not be expected to affect human populations primarily because of the
location and nature of impacts as described here. Oil spills in harbor waters that are
not immediately contained and cleaned up could also have significant impacts on
water quality. Spills or leaks that occur on land are expected to be contained and
cleaned up before any impacts to surface water quality can occur. Spills from the
pipeline are considered highly unlikely (Section 3.12) and thus less than significant
due to the very low likelihood of a pipeline failure occurring in a location where the
oil could reach surface waters. Given the safety features that are incorporated into the
proposed Project, it is also unlikely that a spill during unloading would reach the
Harbor and adversely affect water quality. Because of the nature of the impacts, as
summarized above, the impacts would primarily affect water quality of marine
resources rather than adversely affecting human populations and would therefore not
result in disproportionately high and adverse effects on minority populations or low-
income populations.

5.4.2.3 Beneficial Impacts

Under Executive Order 12898, offsetting benefits should also be considered by
decision-makers when a project would result in disproportionately high and adverse
effects. The proposed Project would create economic benefits in the form of jobs and
income (see Chapter 7, Socioeconomics). In addition, the proposed Project would
enable the Port to successfully meet objectives related to accommodating VLCCs,
maximizing the use of deep-water facilities created for the purpose by the Deep-Draft
Navigation Improvements Project, and optimizing the Port’s overall utilization of
available shoreline. It would enable the Port to use Pier 400 for development that is
consistent with designated uses. It would also allow the Port to provide needed crude
oil marine terminal accessory buildings and structures to support efficient crude oil
unloading and handling, and would construct infrastructure sufficient to
accommodate a portion of the foreseeable volumes of crude oil expected to enter
southern California from overseas sources. It would allow fewer larger ships rather
than a greater number of smaller ships to deliver imported crude oil and petroleum
products by taking advantage of deeper waters at the new berth. Finally, it would
provide a modern liquid bulk terminal that incorporates the latest technologies,
designs, and safety measures.

5.4.3 No Federal Action/No Project Alternative

Under the No Federal Action/No Project Alternative, proposed Project facilities
would not be constructed or operated. As described in Section 2.5.2.1, the No
Federal Action/No Project Alternative considers the only remaining allowable and
reasonably foreseeable use of the proposed Project site: Use of the site for temporary
storage of wheeled containers on the site of Tank Farm 1 and on Tank Farm Site 2. This use would require paving, construction of access roads, and installation of lighting and perimeter fencing.

In addition, for analysis purposes, under the No Federal Action/No Project Alternative a portion of the increasing demand for crude oil imports is assumed to be accommodated at existing liquid bulk terminals in the San Pedro Bay Ports, to the extent of their remaining capacities. Although additional demand, in excess of the capacity of existing marine terminals to receive it, may come in by rail, barge, or other means, rather than speculate about the specific method by which more crude oil or refined products would enter southern California, for analysis purposes, the impact assessment for the No Federal Action/No Project Alternative in this SEIS/SEIR is based on marine deliveries only up to the available capacity of existing crude oil berths. As described in Section 2.5.2.1, the impact assessment for the No Federal Action/No Project Alternative also assumes existing terminals would eventually comply with the California State Lands Commission (CSLC) Marine Oil Terminal Engineering and Maintenance Standards (MOTEMS), that the Los Angeles Harbor Department (LAHD) and the Port of Long Beach would renew the operating leases for existing marine terminals, and that existing terminals would comply with CAAP measures as of the time of lease renewal (i.e., 2008 for Port of Long Beach Berths 84-87, 2015 for LAHD Berths 238-240, and 2023 for Port of Long Beach Berths 76-78).

The NEPA Baseline condition coincides with the No Federal Action/No Project Alternative for this project because the USACE, the LAHD, and the applicant have concluded that, absent a USACE permit, no part of the proposed Project would be built (Section 2.6.1). All elements of the No Federal Action/No Project Alternative are identical to the elements of the NEPA Baseline. Therefore, under a NEPA determination there would be no impact associated with the No Federal Action/No Project Alternative.

The resource analyses in Chapter 3, and the summary of alternatives and impacts in Chapter 6, provide detailed and summary information (respectively) comparing the effects of this alternative with other alternatives and the proposed Project. The focus of this chapter is the potential for disproportionately high and adverse effects on minority and low-income populations.

To facilitate comparison of the potential for disproportionately high and adverse effects on minority and low-income populations between the proposed Project and this alternative, the remainder of this section addresses impacts identified in Section 5.4.2.1; that is, impacts that, under the proposed Project, would be disproportionately high and adverse on minority and low-income populations. This section addresses in turn each of the impacts enumerated in Section 5.4.2.1 and documents whether there would be disproportionately high and adverse effects on minority and low-income populations for this alternative. It is important to note that mitigation measures would not apply to this alternative. In addition, unlike the proposed Project, for the No Federal Action/No Project Alternative, some land use impacts (LU-4 and LU-5) and some ground transportation impacts (TRANS-4 and TRANS-5) are speculative due to lack of specificity as to type, location, and timing, and therefore cannot be determined. As a result, they have not been subject to environmental justice analysis because their significance cannot be determined.
Air Quality (AQ-2): There would be substantially less construction at the proposed Project site and none at off-Port locations (e.g., pipeline sites) under the No Federal Action/No Project Alternative, due to use of Tank Farm Sites 1 and 2 for wheeled container storage rather than the Marine Terminal and related facilities. As a result, for CEQA, there would be a less than significant impact relative to Impact AQ-2 because No Federal Action/No Project Alternative construction would not result in offsite ambient air pollutant concentrations that exceed any of the SCAQMD thresholds of significance. Therefore there would be no disproportionately high and adverse effects on minority and low-income populations with respect to Impact AQ-2.

Air Quality (AQ-4): Like the proposed Project, the No Federal Action/No Project Alternative operations would result in offsite ambient air pollutant concentrations of criteria air pollutants that exceed a SCAQMD threshold of significance; however mitigation measures are not possible because this alternative assumes no discretionary actions. Specifically, the No Federal Action/No Project Alternative would result in offsite exceedances of SCAQMD thresholds for annual concentrations of NO_{2}. Similar to the proposed Project, the No Federal Action/No Project Alternative would result in an individual impact as well as making a cumulative contribution for CEQA. No air quality mitigation measures would apply to the No Federal Action/No Project Alternative.

Because residential areas in San Pedro, Wilmington, and Long Beach are closest to the primary source of the NO_{x} emissions during operations (i.e., ships) and because each of these communities has a concentration of minority populations (over 50 percent), with Wilmington and Long Beach also having a greater concentration of low-income populations than Los Angeles County (low-income populations constitute 32.2 percent of the population in Wilmington and 29.8 percent in Long Beach (also see Figures 5-1 and 5-2 for more detailed data on percentages of minority and low-income populations by Census block group), the elevated ambient concentrations of NO_{2} would constitute a disproportionately high and adverse effect on minority populations and low-income populations. The potential types of human health effects from NO_{2} would be the same as described above.

Air Quality (AQ-5): Like the proposed Project, the No Federal Action/No Project Alternative would create less than significant odor impacts under CEQA, but would make a cumulatively considerable contribution to cumulatively significant odor impacts. Because the impacts would occur in the vicinity of the Ports, which include a predominantly minority population and a low-income population concentration, the No Federal Action/No Project Alternative’s contribution to Cumulative Impact AQ-5 would constitute a disproportionately high and adverse effect on minority and low-income populations.

Air Quality (AQ-6): Increases in toxic emissions from operations of the No Federal Action/No Project Alternative would result in significant cancer risk impacts (i.e., an increased cancer risk of 10 or more cases in a million) compared to the CEQA Baseline. For CEQA, the affected area (with mitigation) contains all or parts of 17 Census tracts (see Figure 5-3). The average minority population percentage among the Census tracts in the affected area is 78.4 percent, and the weighted average low-income population percentage is 43.3 percent. The minority and low-income percentages exceed the relevant thresholds (minority greater than 50 percent and low-income percent greater than Los Angeles County). Therefore, the increased cancer
Figure 5-3. No Federal Action/No Project Alternative (without Mitigation) Minus CEQA Baseline: Affected Area with Increased Residential Cancer Risk of 10 in a Million Cases or More
This page intentionally left blank.
risk would cause disproportionately high and adverse effects on minority and low-income populations under CEQA. The No Federal Action/No Project Alternative would, unlike the proposed Project, make both an individual and a cumulatively considerable and unavoidable contribution to cumulative impacts, and would cause disproportionately high and adverse effects on minority and low-income populations for CEQA due to the high percentages of minority and low-income populations in the vicinity of the Ports.

The No Federal Action/No Project Alternative’s emissions of TACs would increase the acute and chronic non-cancer risk, but the increase would not exceed the 1.0 hazard index significance criterion at any receptor type. However, similar to the proposed Project, any increase in risk represents a cumulatively considerable contribution and would therefore result in a disproportionate impact on minority and low-income populations because of the concentrations of minority and low-income populations closest to the Ports.

It should be noted that port-wide air quality mitigations will be implemented through the Port’s CAAP. Future rulemaking activities by the CARB and USEPA also will reduce future cumulative health impacts. The extent to which these future measures will reduce cumulative health risk impacts within the Port project area is unknown at this time.

**Noise (NOI-1):** Unlike the proposed Project, this alternative would not involve construction of the new Marine Terminal at Pier 400 or related construction of pipelines and other facilities. Although it would include limited construction to allow wheeled container storage at Tank Farm Site 1 and Tank Farm Site 2, this construction would not result in a significant noise impact. As a result, Impact NOI-1 would be less than significant for construction noise and there would be no disproportionately high and adverse effects on minority and low-income populations. The No Federal Action/No Project Alternative also would not result in a cumulatively considerable contribution to construction noise impacts on sensitive receptors, and therefore would not result in disproportionately high and adverse effects on minority and low-income populations.

**Recreation (REC-1.1):** Unlike the proposed Project, construction activities in this alternative would not result in significant nor cumulatively considerable impacts that would result in a substantial loss or diminished quality of recreational, educational, or visitor-oriented opportunities, facilities, or resources. Therefore, Impact REC-1.1 would not result in disproportionately high and adverse effects on minority and low-income populations with respect to construction phase noise effects on recreational resources.

**Recreation (REC-1.2):** Unlike the proposed Project, the No Federal Action/No Project Alternative would not involve new construction, but would involve increased throughput at existing marine terminals in the San Pedro Bay Ports. The No Federal Action/No Project Alternative would therefore also result in significant unavoidable individual and cumulative impacts (under CEQA only) on recreation related to potential oil spills. These impacts would comprise disproportionately high and adverse effects on minority populations and low-income populations because areas in closest proximity to the San Pedro Bay Ports, whose residents could be most affected, are predominantly minority (over 50 percent) and have a higher concentration of low-income populations.
Risk (RISK-5): The No Federal Action/No Project Alternative would not result in the significant unavoidable impacts and resulting public safety consequences associated with a terrorist attack in areas near Pier 400 and the related public safety consequences in the vicinity of the Port. As a result, it also would not result in disproportionately high and adverse effects on minority populations and low-income populations in the vicinity of the Port related to risk from a possible terrorist attack at Pier 400.

5.4.4 Reduced Project Alternative

Under the Reduced Project Alternative, as described in Section 2.5.2.2, construction and operation at Berth 408 would be identical to the proposed Project with the exception of the lease cap limiting throughput in certain years. However, as explained in Section 2.5.2.2, the lease cap would not change the amount of crude oil demanded in southern California, and therefore the analysis of the Reduced Project Alternative also includes the impacts of marine delivery of incremental crude oil deliveries to existing liquid bulk terminals in the San Pedro Bay Ports in years where demand exceeds the capacity of the lease-limited Berth 408.

As described in Section 2.5.2.2, the impact assessment for the Reduced Project Alternative also assumes existing terminals would eventually comply with the MOTEMS, that the LAHD and the Port of Long Beach would renew the operating leases for existing marine terminals, and that existing terminals would comply with CAAP measures as of the time of lease renewal (i.e., 2008 for Port of Long Beach Berths 84-87, 2015 for LAHD Berths 238-240, and 2023 for Port of Long Beach Berths 76-78).

To facilitate comparison of the potential for disproportionately high and adverse effects on minority and low-income populations between the proposed Project and this alternative, the remainder of this section addresses impacts identified in Section 5.4.2.1; that is, impacts that, under the proposed Project, would be disproportionately high and adverse on minority and low-income populations. This section addresses in turn each of the impacts enumerated in Section 5.4.2.1 and documents whether there would be disproportionately high and adverse effects on minority and low-income populations for this alternative.

Air Quality (AQ-2): Like the proposed Project, Reduced Project Alternative construction would result in off-site ambient concentrations of criteria air pollutants – specifically, the 1-hour and annual concentration of NO₂, the 24-hour concentration of PM₁₀, and the 24-hour concentration of PM₂.₅ – that would exceed SCAQMD thresholds of significance, even after implementation of MM AQ-1 through MM AQ-12. This finding applies to the individual impact of the Reduced Project Alternative as well as its cumulative contribution. Since residential areas closest to the construction sites are primarily in Wilmington and have a concentration of minority populations (greater than 50 percent) and low-income population percentage greater than Los Angeles County (Figure 5-2), the elevated ambient concentrations of NO₂, PM₂.₅, and PM₁₀ would constitute a disproportionately high and adverse effect on minority and low-income populations.
Air Quality (AQ-4): Like the proposed Project, Reduced Project Alternative operations would result in offsite ambient air pollutant concentrations of criteria air pollutants that exceed a SCAQMD threshold of significance, even after implementation of mitigation measures. Specifically, the mitigated Reduced Project Alternative would result in offsite exceedances of SCAQMD thresholds for annual concentrations of NO$_2$. This is true for the Reduced Project Alternative’s individual impact and cumulative contribution for both the CEQA and NEPA Baselines. While implementation of mitigation measures would reduce the impact of the Reduced Project Alternative, the impact would remain significant after mitigation.

Since residential areas in San Pedro are closest to the primary source of the NO$_2$ emissions, which are caused by ships, and San Pedro has a concentration of minority populations (Figure 5-1), the elevated ambient concentrations of NO$_2$ would constitute a disproportionately high and adverse effect on minority populations. Potential human health effects from NO$_2$ would be the same as described above under AQ-2 in Section 5.4.2.1.

Air Quality (AQ-5): Like the proposed Project, the Reduced Project Alternative would create less than significant odor impacts under CEQA and NEPA, but would make a cumulatively considerable contribution to cumulatively significant odor impacts. Because the impacts would occur in the vicinity of the Ports, which include a predominantly minority population and a low-income population concentration, the Reduced Project Alternative’s contribution to Cumulative Impact AQ-5 would constitute a disproportionately high and adverse effect on minority and low income populations.

Air Quality (AQ-6). Increases in toxic emissions from operations of the Reduced Project Alternative would result in significant cancer risk impacts (i.e., an increased cancer risk of 10 or more cases in a million) compared to the CEQA Baseline at Reservation Point. Located approximately 0.5 mile (0.8 km) northwest of Pier 400 Reservation Point contains residences for government personnel near the U.S. Coast Guard base; housing for prison wardens at the southern tip; and inmates at the Federal prison. This area is located in Census tract 2961, block group 2. The minority population percentage in the block group is 75.4 percent. The U.S. Census does not report the low-income population percentage for this block group. The minority percentage exceeds the relevant threshold (minority greater than 50 percent). Therefore, the increased cancer risk would cause disproportionately high and adverse effects on minority populations under CEQA. The Reduced Project Alternative would, like the proposed Project, make both an individual and a cumulatively considerable and unavoidable contribution to cumulative impacts and would cause disproportionately high and adverse effects on minority and low-income populations for CEQA due to the high percentages of minority and low-income populations in the vicinity of the San Pedro Bay Ports. Note that the area to which the Reduced Project Alternative would make a cumulatively considerable contribution to cumulatively significant impact for residential cancer risk is larger than Reservation Point because it contains other areas in the vicinity of the San Pedro Bay Ports where toxic emissions would increase as a result of the Reduced Project (see Figures 3.2-7 and 3.2-9), though by less than 10 cases in a million.

In terms of non-cancer effects, the Reduced Project Alternative alone (with and without mitigations) would result in a less than significant impact for acute and
chronic non-cancer effects under CEQA and NEPA. However, increases in TACs from Reduced Project Alternative construction and operation, even with mitigations, would result in a cumulatively considerable contribution to cumulatively significant impacts for chronic non-cancer risks at residential and other sensitive receptors under both CEQA and NEPA, and for acute non-cancer risks at residential and other sensitive receptors under CEQA. Because the impacts would occur in the vicinity of the Port, which includes a predominantly minority population and a low-income population concentration, the contribution of the Reduced Project Alternative to cumulative non-cancer impacts would constitute a disproportionately high and adverse effect on minority populations and low-income populations. No mitigation beyond the proposed air quality mitigations identified above is proposed.

**Noise (NOI-1):** Like the proposed Project, the Reduced Project Alternative construction activities lasting more than 10 days in a 3-month period would exceed existing ambient exterior noise levels by 5 dB(A) or more at a noise-sensitive use. The Reduced Project Alternative would produce significant unavoidable construction noise impacts (both project and cumulative) under both CEQA and NEPA at three sensitive receptors: Area 1 (Berth 204), Area 2 (Lighthouse Yacht Landing) and Area LR-2 (Reservation Point) (see Figure 3.10-1 for locations). Despite the application of all feasible mitigation measures, construction activities at each of these locations would cause temporary and periodic noise levels substantially above existing ambient noise levels in the area.

Areas 1 (Berth 204) and 2 (Lighthouse Yacht Landing) are marinas with live-aboard slips in Wilmington. Pipeline construction is projected to cause a 7 dB(A) increase in noise levels at both Berth 204 and Lighthouse Yacht Landing. Area LR-2 is located on the southeastern-most tip of Reservation Point approximately 0.5 mile (0.8 km) northwest of Pier 400 and contains housing for prison wardens and naval officers. Construction would result in a temporary 11 dB(A) increase in noise levels over existing conditions at Area LR-2. Noise impacts at Areas 1, 2 and LR-2 would be temporary, but significant because they would exceed the 5 dB(A) increase criterion.

Areas 1 and 2 are located in Census Tract 2947, block group 3. The minority percentage for this block group is 52.6 percent which is higher than 50 percent. The low-income percentage for the block group is 12.8 percent, which would be lower than Los Angeles County. Thus, there would be disproportionate effects on minority populations from significant unavoidable noise impacts during construction at Area 1 Berth 204 and Area 2 Lighthouse Yacht Landing. This alternative would make a cumulatively considerable contribution to a significant cumulative impact, due to construction period noise impacts from the Reduced Project Alternative as well as construction in other locations identified in Section 4.2.10. Like the individual impacts, these significant cumulative impacts would disproportionately affect minority populations.

Area LR-2 is located within Census Tract 2961, block group 2. The minority percentage for this block group is 75.4 percent, which is higher than 50 percent and also higher than Los Angeles County. The U.S. Census does not report poverty data for this block group. Census Tract 2961, a larger area, is 31 percent low-income. Based on the minority percentage for the Census block group, there would be disproportionate effects on minority populations from significant unavoidable noise impacts during construction at Area LR-2 on Reservation Point. The project would
make a cumulatively considerable contribution to a significant cumulative impact, due to construction period noise impacts from the project as well as construction in other locations identified in Section 4.2.10. Like the Project-specific impacts, these significant cumulative impacts would disproportionately affect minority populations.

**Recreation (REC-1.1):** Significant unavoidable individual and cumulative construction noise impacts and the related disproportionate effects on the minority and low-income populations would be the same as for the proposed Project because the same facilities would be built. Users of four recreation areas would be affected, including two marinas at Area 1 (Berth 204) and Area 2 (Lighthouse Yacht Landing), Area 21 (Stephen White Street and Oliver Vickery Circle Way, which was used as the receptor location representing noise conditions at Cabrillo Beach) and conditions in the Los Angeles Harbor for recreational boaters (represented by LR-2, Reservation Point). (See Figure 3.10-1 for locations).

**Recreation (REC-1.2):** Effects would be similar to the proposed Project, due to operations at Berth 408, but also at LAHD Berths 238-240 and at Port of Long Beach Berths 76-78 and 84-87. In the event of an oil spill, the Reduced Project Alternative could result in a temporary substantial loss or diminished quality of recreational, educational, or visitor-oriented opportunities, facilities, or resources, which would be an individually significant, cumulatively considerable, and unavoidable impact under CEQA and NEPA. This impact would occur despite implementation of MM RISK-2.1a (double-hulled vessels) and MM RISK 2.1b (quick release couplings). An accidental oil spill during vessel offloading activities at the proposed Berth 408 could degrade harbor fisheries, thereby diminishing the quality of recreational fishing at Cabrillo Beach, as well as limiting or even precluding certain on-water boating opportunities for the duration of any cleanup effort. Oil reaching recreational marinas could coat vessels moored there and, potentially, foul cooling water intakes and other below waterline fittings with potential adverse effects. Vessels coated with oil would need to be cleaned prior to future use. Beaches in the vicinity of an oil spill would potentially be oiled and require cleanup, which typically would preclude recreational uses during the cleanup effort. Depending on the size of spill, cleanup and the associated preclusion of recreational uses could last from several days to several weeks or months.

Cabrillo Beach and Fishing Pier are located in Census tract 2976, block group 9 where the minority percentage is below 50 percent and the low-income percentage is below that of Los Angeles County. However, because these facilities and other coastal recreational facilities and marinas at or near the San Pedro Bay Ports would be used not just by those living close by, and because the percentages of minority and low-income populations in the vicinity are generally higher than other areas, as well as the fact that low-income users may rely on use of public (i.e., lower cost) recreational resources more than other users, there would be a disproportionate effect under both CEQA and NEPA, individually and cumulatively, on minority and low-income residents from **Impact REC-1.2**.

**Risk (RISK-5):** Similar to the proposed Project, even with the application of all possible mitigation measures, potential residual impacts related to terrorism risk from the Reduced Project Alternative would be considered significant given the environmental and public safety consequences associated with a successful terrorist attack. Impacts of significant and unavoidable Reduced Project and cumulative
impacts from RISK-5 under both CEQA and NEPA would result in disproportionately high and adverse effects on minority and low-income populations because the impacts could occur in the vicinity of the Port, which includes a predominantly minority and a low-income population concentration.

### 5.4.5 Summary of Disproportionate Effects on Minority and Low-Income Populations

Table 5-3 summarizes the effects of the proposed Project and alternatives with respect to disproportionately high and adverse effects on minority and low-income populations. Significant and unavoidable project and cumulative air quality, noise, recreation, and risk of upset impacts would constitute disproportionate effects. All other resource impacts would either be less than significant or if significant, would be limited to the proposed Project site, would not affect the public, would be mitigated to less than significant, or would otherwise not be disproportionately high and adverse effects on minority and low-income populations.

| No Federal Action/No Project    | Disproportionate effects on minority populations and low-income populations from unavoidable project and cumulative impacts would occur due to the following. Note that the location and extent of operations effects would differ from proposed Project due to the different emissions footprint (e.g., due to increased throughput at existing terminals in the San Pedro Bay Ports).  
  • significant impact on, and cumulatively considerable contribution to, ambient concentrations of NO$_2$ during operations (Impact AQ-4)  
  • cumulatively considerable contribution to cumulatively significant impact odor impacts (Impact AQ-5)  
  • significant impact on, and cumulatively considerable contribution to, cancer risk under CEQA (Impact AQ-6)  
  • cumulatively considerable contribution to acute and chronic non-cancer risks under CEQA (Impact AQ-6). | No disproportionate effects. | No disproportionate effects. | Disproportionate Project and cumulative effects on minority and low-income populations during operations, due to increased tanker activity and related to risk of oil spills on beaches and other coastal recreation areas (Impact REC-2.2). | Benefits include some increase in supply from exiting marine terminals to meet a portion of the projected demand for crude oil in southern California, and avoidance of some disproportionate effects as summarized in the columns for air quality, risk of upset, noise, and recreation. Note that some land use and ground transportation impacts of the No Federal Action/No Project Alternative were found to be speculative due to lack of specificity as to type, location, and timing of impact, and therefore their significance cannot be determined. As a result, they have not been subjected to environmental justice analysis. |

5.5 Public Outreach

CEQA and NEPA require that federal, state, and local government agencies consider the environmental consequences of projects over which they have discretionary authority before taking action on them. The purpose of this Draft SEIS/SEIR is to inform agencies and the public of significant environmental effects associated with the proposed Project, to describe and evaluate reasonable alternatives to the proposed Project, and to propose mitigation measures that would avoid or reduce the significant effects of the proposed Project.

The LAHD has made considerable efforts to provide public outreach, beyond what is minimally required by the CEQA Guidelines. All Notices of Preparation/Initial Studies (NOPs/ISs) and Draft EISs and EIRs are presented at public meetings at locations and times convenient for the affected community. The meetings are held at the Port Administration Building or in the community, depending on the location of the project.

Notification of availability of documents is extensive and utilizes a variety of media. CEQA notices are placed in six newspapers: the Los Angeles Times, Daily Breeze, La Opinion, Sentinel, Long Beach Press Telegram, and Metropolitan News. Meeting notices are sent to all active community organizations and to anyone who has requested to be on the LAHD CEQA mailing list. Postcards noticing the document and any public meetings also are sent to all San Pedro and Wilmington addresses. A free copy of documents is provided to community organizations.

The LAHD also consults with affected community groups through the Port Community Advisory Committee (PCAC), a special stakeholder advisory committee of the Los Angeles Board of Harbor Commissioners. This committee, which meets monthly, includes representatives from a number of community groups. The PCAC also has subcommittees and focus groups that address a broad range of environmental issues, including studies on those impacts that might result in disproportionate impacts on relevant populations. Greater detail regarding PCAC involvement and Port outreach is available in Appendix C.

The USACE has provided opportunities for public participation in the Draft SEIS/SEIR process through publication in the Federal Register of a Notice of Intent to prepare the SEIS, followed by a public comment period for submitting comments on the scope of the environmental analysis; publication of a Notice of Availability in the Federal Register (when the Draft SEIS/SEIR was publicly circulated), and a public comment period on the Draft SEIS/SEIR.

5.5.1 Alternative Forms of Distribution

This Draft SEIS/SEIR has been distributed directly to numerous agencies, organizations, and interested groups and persons for comment during the formal review period. The Draft SEIS/SEIR also has been made available for review at the LAHD Environmental Management Division, the USACE Los Angeles District Office, at three Los Angeles public library branches (Central, San Pedro, and
Wilmington), and the Long Beach Public Library (main branch). In addition to the printed copies, the Draft SEIS/SEIR also is available in electronic format on the LAHD website, at: http://www.portoflosangeles.org/environment/public_notices.asp, and is available at no cost on CD-ROM.

5.5.2 Spanish Translation

With a large Hispanic population adjacent to the Port, meeting notifications and executive summaries of major CEQA and NEPA documents will be provided in Spanish as well as English. The Executive Summary of this Draft SEIS/SEIR is available in a Spanish translation. The purpose is to assist Spanish-speaking members of the local community in understanding the purpose of the Draft SEIS/SEIR, project overview, project description, environmental impacts, alternatives to the proposed Project, areas of controversy, and issues to be resolved.

The LAHD also provides an interpreter at public meetings, where required, and publishes its regular community newsletter, The Main Channel, in both English and Spanish.
