Section 3.11
Noise

SECTION SUMMARY

This section addresses the potential noise impacts associated with the construction and the operation of the proposed Project or an alternative. The sound from the proposed Project and the potential effect on the surrounding area could result from increasing container-handling capacities at the proposed Project site.

Section 3.11, Noise, provides the following:

- A description of existing environmental setting in the Port area;
- A description of the existing sound levels in the surrounding area;
- A description of decibel scale;
- A description of applicable local, state, and federal regulations and policies that apply to the proposed Project and alternatives;
- A discussion on the methodology used to determine whether the proposed Project or alternatives would result in a noise impact;
- An impact analysis of both the proposed Project and alternatives; and,
- A description of any mitigation measures proposed to reduce any potential impacts, as applicable.

Key Points of Section 3.11:

The proposed Project and alternatives would expand an existing container terminal, and its operations would be consistent with other uses and container terminals in the Project area.

The proposed Project and Alternatives 5 and 6 would result in a significant noise impact to noise sensitive uses at Reservation Point and Fish Harbor during construction under both CEQA and NEPA, to noise sensitive uses at Reservation Point and Fish Harbor. The following mitigation measures would reduce potentially significant impacts to less than significant levels:

- **MM NOI-1: Noise Reduction during Pile Driving.** The contractor shall be required to use a pile driving system, such as a Bruce hammer (with silencing kit), an IHC Hydrohammer SC series (with sound insulation system), or equivalent silenced hammer, which is capable of limiting maximum noise levels at 50 ft from the pile driver to 104 dBA, or less, for wharf construction. With implementation of Standard Condition of approval **SC BIO-1**, the pile driving would initiate with a soft start, in which the hammer is operated at a reduced energy, followed by a waiting period. The soft start technique would induce marine mammals and birds to leave the area.
immediate area before pile hammer reaches full energy. Refer to Section 3.3, Biological Resources, for information on soft start of pile driving activities.

- **MM NOI-2: Erect Temporary Noise Attenuation Barriers Adjacent to Pile Driving Equipment, Where Necessary and Feasible.** Erect temporary noise attenuation barriers suitable for pile driving equipment as needed. The barriers should be installed directly between the equipment and the nearest noise sensitive use to the construction site. The need for and feasibility of noise attenuation barriers should be evaluated on a case-by-case basis considering the distance to noise sensitive receptors, the available space at the construction location, and taking account of safety and operational considerations.

Operation of the proposed Project and its alternatives would not result in significant impacts to these or noise sensitive uses in the Port area.
3.11.1 Introduction

This section described the existing noise conditions in the Project area, describes applicable regulations and thresholds, and addresses potential noise impacts that could result from the proposed Project and alternatives.

3.11.2 Environmental Setting

3.11.2.1 Noise Fundamentals

Noise may be defined as unwanted sound. Noise is usually objectionable because it is disturbing or annoying. The objectionable nature of sound can be caused by its *pitch* or its *loudness*. *Pitch* of a tone or sound depends on the relative rapidity (frequency) of the vibrations by which it is produced. *Loudness* is the amplitude of sound waves combined with the reception characteristics of the ear. Amplitude may be compared with the height of an ocean wave. Technical acoustical terms commonly used in this section are defined in Table 3.11-1.

3.11.2.2 Decibels and Frequency

In addition to the concepts of pitch and loudness, there are several noise measurement scales that are used to describe noise. The *decibel (dB)* is a unit of measurement, which indicates the relative amplitude of a sound. Zero on the decibel scale is based on the lowest sound pressure that a healthy, unimpaired human ear can detect. Sound levels in decibels are calculated on a logarithmic basis. An increase of 10 decibels represents a 10-fold increase in acoustic energy, while 20 decibels is 100 times more intense, 30 decibels is 1,000 times more intense, etc. There is a relationship between the subjective noisiness or loudness of a sound and its level. Each 10-decibel increase in sound level is perceived as approximately a doubling of loudness over a wide range of amplitudes. Because decibels are logarithmic units, sound pressure levels are not added arithmetically. When two sounds of equal sound pressure level are added, the result is a sound pressure level that is 3 dB higher. For example, if the sound level were 70 dB when 1,000 cars pass by, then it would be 73 dB when 2,000 cars pass the observer. Doubling the amount of energy would result in a 3 dB increase to the sound level.
### Table 3.11-1: Definitions of Acoustical Terms

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Decibel (dB)</td>
<td>A unit describing the amplitude of sound, equal to 20 times the logarithm to the base 10 of the ratio of the pressure of the sound measured to the reference pressure. The reference pressure for air is 20 micro Pascals.</td>
</tr>
<tr>
<td>Sound Pressure Level</td>
<td>Sound pressure is the sound force per unit area, usually expressed in micro Pascals (or micro Newtons per square meter), where 1 Pascal is the pressure resulting from a force of 1 Newton exerted over an area of 1 square meter. The sound pressure level is expressed in decibels as 20 times the logarithm to the base 10 of the ratio between the pressures exerted by the sound to a reference sound pressure (e.g., 20 micro Pascals in air). Sound pressure level is the quantity that is directly measured by a sound level meter.</td>
</tr>
<tr>
<td>Frequency (Hz)</td>
<td>The number of complete pressure fluctuations per second above and below atmospheric pressure. Normal human hearing is between 20 Hz and 20,000 Hz. Infrasonic sounds are below 20 Hz and ultrasonic sounds are above 20,000 Hz.</td>
</tr>
<tr>
<td>A-Weighted Sound Level (dBA)</td>
<td>The sound pressure level in decibels as measured on a sound level meter using the A-weighting filter network. The A-weighting filter de-emphasizes the very low and very high frequency components of the sound in a manner similar to the frequency response of the human ear and correlates well with subjective reactions to noise.</td>
</tr>
<tr>
<td>Equivalent Noise Level (L&lt;sub&gt;eq&lt;/sub&gt;)</td>
<td>The average A-weighted noise level during the measurement period. The hourly L&lt;sub&gt;eq&lt;/sub&gt; used for this report is denoted as dBA L&lt;sub&gt;eq[h]&lt;/sub&gt;.</td>
</tr>
<tr>
<td>Community Noise Equivalent Level (CNEL)</td>
<td>The average A-weighted noise level during a 24-hour day, obtained after addition of 5 decibels to sound levels in the evening from 7:00 p.m. to 10:00 p.m. and after addition of 10 decibels to sound levels in the night between 10:00 p.m. and 7:00 a.m.</td>
</tr>
<tr>
<td>Day/Night Noise Level (L&lt;sub&gt;dn&lt;/sub&gt;)</td>
<td>The average A-weighted noise level during a 24-hour day, obtained after addition of 10 decibels to levels measured in the night between 10:00 p.m. and 7:00 a.m.</td>
</tr>
<tr>
<td>L&lt;sub&gt;01&lt;/sub&gt;, L&lt;sub&gt;10&lt;/sub&gt;, L&lt;sub&gt;50&lt;/sub&gt;, L&lt;sub&gt;90&lt;/sub&gt;</td>
<td>The A-weighted noise levels that are exceeded 1%, 10%, 50%, and 90% of the time during the measurement period.</td>
</tr>
<tr>
<td>Ambient Noise Level</td>
<td>The composite of noise from all sources near and far. The normal or existing level of environmental noise at a given location.</td>
</tr>
<tr>
<td>Intrusive</td>
<td>That noise which intrudes over and above the existing ambient noise at a given location. The relative intrusiveness of a sound depends upon its amplitude, duration, frequency, time of occurrence, and tonal or informational content, as well as the prevailing ambient noise level.</td>
</tr>
</tbody>
</table>

---

1. Frequency relates to the number of pressure oscillations per second, or Hertz (Hz). The range of sound frequencies that can be heard by healthy human ears is from about 20 Hz at the low frequency end to 20,000 Hz (20 kilohertz [kHz]) at the high frequency end.
There are several methods for characterizing sound. The most common is the *A-weighted sound level* or *dBA*. This scale gives greater weight to the frequencies of sound to which the human ear is most sensitive. Studies have shown that the A-weighted level is closely correlated with annoyance to noise. Other frequency weighting networks, such as *C weighting* or *dBC*, have been devised to describe noise levels for specific types of noise (e.g., explosives). Table 3.11-2 shows typical A-weighted noise levels that occur in human environments.

### 3.11.2.2.1 Noise Descriptors

Because sound levels can vary markedly over a short period of time, a method for describing either the average character of the sound or the statistical behavior of the variations is utilized. Most commonly, environmental sounds are described in terms of an average level that has the same acoustical energy as the summation of all the time-varying events. This energy-equivalent sound/noise descriptor is called $L_{eq}$. A common averaging period is hourly, but $L_{eq}$ can describe any series of noise events of arbitrary duration. The scientific instrument used to measure noise is the sound level meter. Sound level meters can accurately measure environmental noise levels to within approximately plus or minus 1 dBA. Two metrics describe the 24-hour average, $L_{dn}$ and CNEL (defined in Table 3.11-1). Both include penalties for noise during the nighttime, and CNEL penalizes noise during the evening. CNEL and $L_{dn}$ are normally within 1 dBA of each other and are used interchangeably in this section.

### 3.11.2.2.2 Human Response to Noise

Studies have shown that under controlled conditions in an acoustics laboratory, a healthy human ear is able to discern changes in sound levels of 1 dBA. In the normal environment, the healthy human ear can detect changes of about 2 dBA; however, it is widely accepted that changes of 3 dBA in the normal environment are considered just noticeable to most people. A change of 5 dBA is readily perceptible, and a change of 10 dBA is perceived as being twice as loud.

### 3.11.2.2.3 Sound Propagation

When sound propagates over a distance, it changes in both level and frequency content. The manner in which noise is reduced with distance depends on the following important factors:

**Geometric spreading.** Sound from a single source (i.e., a “point” source) radiates uniformly outward as it travels away from the source in a spherical pattern. The sound level attenuates (or drops off) at a rate of 6 dBA for each doubling of distance. Highway noise is not a single stationary point source of sound. The movement of vehicles on a highway makes the source of the sound appear to emanate from a line (i.e., a “line” source) rather than from a point. This results in cylindrical spreading rather than the spherical spreading resulting from a point source. The change in sound level (i.e. attenuation) from a line source is 3 dBA per doubling of distance.

**Ground absorption.** Usually the noise path between the source and the observer is very close to the ground. Noise attenuation from ground absorption and reflective wave canceling adds to the attenuation because of geometric spreading. Traditionally, the excess attenuation has also been expressed in terms of attenuation per doubling of distance. This approximation is done for simplification only; for distances of less than 60 meters (200 ft), prediction results based on this scheme are sufficiently accurate. For acoustically “hard” sites (i.e., sites with a reflective surface, such as a parking lot or a smooth body of water, between the source and the receiver), no excess ground attenuation is assumed. For acoustically absorptive or “soft” sites (i.e., sites with an absorptive ground surface, such as soft dirt, grass, or scattered bushes and trees), an excess ground attenuation value of 1.5 dBA per doubling of distance is normally assumed. When added to the geometric spreading, the excess ground attenuation results...
in an overall drop-off rate of 4.5 dBA per doubling of distance for a line source and 7.5
dBA per doubling of distance for a point source.

**Atmospheric effects.** Research by Caltrans and others has shown that atmospheric
conditions can have a major effect on noise levels. Wind has been shown to be the single
most important meteorological factor within approximately 150 meters (500 ft), whereas
vertical air temperature gradients are more important over longer distances. Other
factors, such as air temperature, humidity, and turbulence, also have major effects.
Receivers located downwind from a source can be exposed to increased noise levels
relative to calm conditions, whereas locations upwind can have lower noise levels.
Increased sound levels can also occur because of temperature inversion conditions (i.e.,
increasing temperature with elevation, or cooler air near the surface, where the sound
source tends to be and warmer air above which acts as a cap, causing a reflection of
ground level generated sound).

**Shielding by natural or human-made features.** A large object or barrier in the path
between a noise source and a receiver can substantially attenuate noise levels at the
receiver. The amount of attenuation provided by this shielding depends on the size of the
object, proximity to the noise source and receiver, surface weight, solidity, and the
frequency content of the noise source. Natural terrain features (such as hills and dense
woods) and human-made features (such as buildings and walls) can substantially reduce
noise levels. Walls are often constructed between a source and a receiver specifically to
reduce noise. A barrier that breaks the line of sight between a source and a receiver will
typically result in at least 5 dB of noise reduction. A higher barrier may provide as much
as 20 dB of noise reduction.

**3.11.2.4 Existing Noise Environment**

The proposed Project site is located on Terminal Island within an industrial area in the
Fish Harbor region of the Port. The site is within the Port of Los Angeles Plan area of in
the City of Los Angeles, which is adjacent to the communities of San Pedro and
Wilmington. The site is generally bounded on the north by Terminal Way, the Pier 300
Shallow Water Habitat on the east, Earle Street on the west, and the Pier 300 Channel on
the south. Noise in the proposed Project site is characterized by periodic increases in
noise levels associated with adjacent container terminal and industrial uses, railroad train
movements along the various railroad lines in the area, vehicular traffic on the local street
network and the freeways, industrial noise sources, and activities at the Port. The noise
environment at any particular location depends upon proximity to the various noise
sources, although traffic noise is the predominant noise source in the Project area. Some
noise-sensitive receivers are also located near the rail corridors in the environs of the
Port.

For the purpose of this report, noise-sensitive receivers are defined as residences, schools,
hospitals, libraries, places of worship, and public parks. Figure 3.11-1 shows noise-
sensitive receivers in the Project vicinity. The nearest residential area outside of the Port
is located more than one mile to the west, across the Main Channel of the Los Angeles
Harbor. There are also Port-related residential uses at Reservation Point and in the
Cabrillo Beach area, along with liveaboard boats in Fish Harbor and the Cerritos Channel
just west of the Terminal Island Freeway (State Route 47) Bridge. For the purposes of
noise impact analysis, the area of influence includes those sensitive receptors closest to
the proposed Project site, which might potentially be affected by construction noise or
Figure 3.11-1: Noise Measurement Locations

noise associated with traffic generated by the proposed Project or an alternative and
sensitive receptors along major transportation corridors serving the Project area.

3.11.2.2.5 Noise Monitoring

Noise monitoring surveys were conducted in March/April 2008 and September 2009 to
quantify existing ambient noise levels at representative locations near the Project area and
major transportation corridors serving the Project area. Noise levels were monitored
during the daytime, evening, and nighttime in consecutive hourly intervals at several
locations (long-term monitoring locations are denoted by “LT”, specifically, LT-1, LT-2,
L3, LT-4, and LT-5), which are indicated on Figure 3.11-1 and discussed below. The
results of the noise measurements are shown in Figures 3.11-2 through 3.11-6. The
figures provide the range of noise levels measured during each hour depicted by the
statistical descriptors $L_{90}$, $L_{50}$, $L_{10}$, and $L_{01}$, as well as the maximum noise level and the
energy average or equivalent sound level, $L_{eq(50)}$. Although not required, the statistical
noise levels ($L_n$) were obtained to provide further perspective on background noise levels.
The measured CNEL, the 24-hour (day/evening/night) average noise level, also is shown
in each figure.

Measurement LT-1 was made on a pylon at the end of a residential pier within the Island
Yacht Anchorage liveaboard community at an approximate distance of 30 yards to rail
cars on the adjacent railroad bridge and 60 yards to trucks passing on the adjacent
freeway bridge. This location is representative of the closest residences to the rail and
road bridges across the Cerritos Channel. The primary noise source at this location was
rail and truck traffic on the bridges crossing the Cerritos Channel. The hourly trends in
noise levels measured between 1:00 p.m. on Monday September 28, 2009 and 1:00 p.m.
on Tuesday September 29, 2009, including the energy equivalent noise level ($L_{eq}$), and
the noise levels exceeded 01, 10, 50 and 90 percent of the time (indicated as $L_{01}$, $L_{10}$, $L_{50}$
and $L_{90}$), are shown on Figure 3.11-2. The daytime and nighttime average ($L_{eq}$) noise
levels at this location ranged from 70 to 75 dBA and 66 to 72 dBA, respectively, with an
average daytime $L_{eq}$ of 73 dBA and an average nighttime $L_{eq}$ of 70 dBA. The CNEL at
this location was 77 dBA.

Measurement LT-2 was made on a pylon at the end of a residential pier E within the
Al Larson Marina liveaboard community, at an approximate distance of 900 ft to the
westernmost (closest) portion of the proposed Project site. This location is representative
of the closest Port-related residences to the proposed Project site. The primary noise
source at this location was local activities at the marina, and activities at the adjacent
Al Larson boat repair facility. Occasional Port-related activities were also audible at this
location. The hourly trends in noise levels measured between 2:00 p.m. on Monday
September 28, 2009 and 2:00 p.m. on Tuesday September 29, 2009, including the energy
equivalent noise level ($L_{eq}$) and the noise levels exceeded 01, 10, 50 and 90 percent of the
time (indicated as $L_{01}$, $L_{10}$, $L_{50}$ and $L_{90}$), are shown on Figure 3.11-3. The daytime and
nighttime average ($L_{eq}$) noise levels at this location ranged from 54 to 61 dBA and 47 to
60 dBA, respectively, with an average daytime $L_{eq}$ of 57 dBA and an average nighttime
$L_{eq}$ of 54 dBA. The CNEL at this location was 62 dBA.

Figure 3.11-5: Hourly Noise Levels at LT-4
Figure 3.11-6: Hourly Noise Levels at LT-5
Measurement LT-3 was made on a light standard at the corner of South Beacon Street and West 12th Street in the San Pedro residential district, at an approximate distance of 5,000 ft to the westernmost (closest) portion of the proposed Project site. This location is representative of the closest residences within San Pedro to the proposed Project site. The primary noise source at this location was local traffic on Beacon Street and more distant traffic on Harbor Boulevard. Port-related noise was not distinctly audible at this location. The hourly trends in noise levels measured between 2:00 p.m. on Monday September 28, 2009 and 2:00 p.m. on Tuesday September 29, 2009, including the energy equivalent noise level (Leq) and the noise levels exceeded 01, 10, 50 and 90 percent of the time (indicated as L01, L10, L50 and L90), are shown on Figure 3.11-4. The daytime and nighttime average (Leq) noise levels at this location ranged from 58 to 74 dBA and 49 to 59 dBA, respectively with an average daytime Leq of 65 dBA and an average nighttime L_{eq} of 55 dBA. The CNEL at this location was 65 dBA.

Measurement LT-4 was located at the intersection of Oliver Vickery Circle Way and Stephen M. White Drive, approximately 23 ft from the centerline of Stephen M. White Drive. This location is representative of the noise environment at residences in the Cabrillo Beach area. The primary noise source at this location was local traffic. Port-related noise was not distinctly audible at this location. The hourly trends in noise levels measured between 4:00 p.m. on Friday March 28, 2008, and 2:00 p.m. on Monday March 31, 2008, including the energy equivalent noise level (Leq) and the noise levels exceeded 01, 10, 50 and 90 percent of the time (indicated as L01, L10, L50 and L90), are shown on Figure 3.11-5. Typical hourly average daytime noise levels ranged from 52 to 64 dBA Leq and nighttime noise levels typically ranged from 47 to 58 dBA Leq. The calculated CNEL for the entire measurement period was 61 dBA, with the CNEL over the weekend days at 60 to 61 dBA, and the calculated CNEL for an equivalent weekday period of 61 dBA.

Measurement LT-5 was located at the Federal housing facility on Reservation Point, approximately 60 ft from the nearest residence. The primary noise sources at this location were local facility and Port-related activities. The hourly trends in noise levels measured between 4:00 p.m. on Friday March 28, 2008 and 2:00 p.m. on Monday March 31, 2008, including the energy equivalent noise level (Leq) and the noise levels exceeded 01, 10, 50 and 90 percent of the time (indicated as L01, L10, L50 and L90), are shown on Figure 3.11-6. Typical hourly average daytime noise levels ranged from 47 to 62 dBA Leq and nighttime noise levels typically ranged from 46 to 56 dBA Leq. The calculated CNEL for the entire measurement period was 59 dBA, with the CNEL over the weekend days and calculated for an equivalent weekday period also at 59 dBA.

Short-term (ST) noise measurements were made at representative locations (depicted as Sites ST-1 through ST-8 in Figure 3.11-1). The results of the short-term noise level measurements are summarized in Table 3.11-3.

Site ST-1 was at the Anchorage Road Frontage of the Island Yacht Anchorage liveaboard community at an approximate distance of 35 yards to rail cars on the adjacent railroad bridge and 65 yards to trucks passing on the adjacent freeway bridge. Truck traffic on the Terminal Island Freeway Bridge and rail traffic on the rail bridge was the dominant noise source at this location, typically producing levels between 65 and 68 dBA.
Site ST-2 was at the Terminal Island Memorial south of the Al Larson Boat Dock near Firehouse 111 and approximately 1,100 ft west of the westernmost portion of the proposed Project site. The primary noise source at this location was local traffic on Seaside Avenue at between 58 to 64 dBA. Other measurable noise sources at this location were activities at the adjacent firehouse at between 52 to 55 dBA, bird and sea lion sounds at between 52 to 54 dBA, and a passing tugboat at between 51 to 52 dBA. Though unloading activities at both Piers 300 and 400 were observed during the measurement period, these activities were not audible or measurable over other area ambient noise.

Site ST-3 was at the linear park along South Harbor Boulevard, 150 ft from the centerline of the roadway and approximately 1,700 ft from the mid-point of the closer of two cargo ships that was being unloaded by two gantry cranes at the Evergreen Terminal on the opposite side of the Main Channel from the measurement position. Measurements at this position were made on an intermittent basis between auto traffic on South Harbor Boulevard over a 20-minute period. Constant crane operation produced noise levels of between 55 and 56 dBA at the measurement location, with noise produced by typical setting of containers at levels of up to 57 dBA, and banging of containers during movements and setting typically between 58 and 60, with one event reaching 64 dBA. During the measurement period a tugboat also passed through the channel producing a level of 58 dBA; ground based, truck loading, cranes produced sound levels between 58 and 59 dBA; and back up beepers were audible, but not measurable over ambient conditions.

Site ST-4 was at the northeast corner of the Firehouse 112 wharf, approximately 500 ft from the centerline of South Harbor Boulevard, and 1,600 ft from the mid-point of the closest of two cargo ships that was being unloaded by two gantry cranes at the Evergreen Terminal and 335 yards from ground based containers on the opposite side of the main channel. Roadway traffic noise was not a significant noise source at this measurement position. The operation of crane engines produced noise levels of between 56 and 57 dBA at the measurement location, with gear noise occasionally to 57 to 58 dBA, and banging of containers during movements and setting typically between 57 and 64. A ship horn was also heard, producing a level of 57 to 58 dBA. Truck movements at the opposite shore of the channels and the banging of ground-based containers were audible at this position producing sound levels of between 56 and 60 dBA. During the measurement period a tugboat and another small craft also passed through the channel producing levels of between 56 to 57 dBA.

Site ST-5 was at the northeast corner of the police training area north of Firehouse 112, approximately 700 ft from the centerline of South Harbor Boulevard, and 1,200 ft from the mid-point of the closest of two cargo ships that was being unloaded by two gantry cranes at the Evergreen Terminal. Roadway traffic noise was not a significant noise source at this measurement position; however, a siren on Harbor Boulevard did produce a level of 63 dBA. The operation of crane engines produced noise levels of between 56 and 57 dBA at the measurement location, with the occasional banging of containers during movements and setting typically between 58 and 59, with loud bangs up to 65 dBA at times. Truck accelerations and air brakes on the opposite shore of the channel were also audible, producing sound levels of between 57 and 59 dBA. During the measurement period a tugboat passed through the channel producing levels of between 58 to 59 dBA.
Site ST-6 was made at the corner of East Young Street and East Grant Street in the neighborhood opposite the railroad from the intersection of Alameda Street and Henry Ford Avenue. The measurement position was approximately 90 ft from center of the rail line heading northeast, approximately 115 ft from center of rail line crossing the roadways, 135 ft from the centerline of Alameda Street, and 185 ft from the centerline of Henry Ford Avenue. Truck and rail traffic were the dominant noise sources at this location, with trucks producing average noise levels between 64 to 65 dBA and maximum noise levels between 67 to 69 dBA, and train engines producing noise levels of between 65 to 66 dBA and train horns reaching maximum levels of 73 to 78 dBA.

Site ST-7 was located in front of 3807 Stephen M. White Drive, approximately 30 ft to the center of the roadway. Local traffic and small aircraft were the predominant sources of noise during the survey. Port-related noise was not audible at this location.

Site ST-8 was located adjacent to LT-5, at the southeast end of Reservation Point, approximately 60 ft from the nearest residence. Aircraft and wind were the predominant sources of noise during the survey. Port-related noise was not a major source of noise at this location.

3.11.3 Applicable Regulations

The *LA CEQA Thresholds Guide* (City of Los Angeles, 2006) includes the following checklist questions regarding environmental noise impacts:

a. Would the project result in exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?

b. Would the project result in exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels?

c. Would the project result in a substantial permanent increase in ambient noise levels in the project vicinity above levels existing without the project?

d. A substantial temporary or periodic increase in ambient noise levels in the project vicinity above the existing without the project?

e. For a project located within an airport land use plan, or where such a plan has not been adopted within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?

f. For a project within the vicinity of a private airstrip, would the project expose people residing or working in the project area to excessive noise levels?

Significance criteria are established to address questions a, c, and d for potential noise impacts during each of the two stages of construction and operation proposed for the proposed Project and alternatives. Question b would not apply because groundborne noise and vibrations attenuate through the change in ground motility when passing under water covered areas (i.e. the channels at the Port), and because there are no sensitive receptors on the proposed Project side of water filled channels. Questions e and f are not applicable to this assessment. Background information is presented in the following paragraphs regarding applicable or related regulations adopted by the City of Los Angeles or other agencies.

3.11.3.1 City of Los Angeles Municipal Code

Section 41.40 of the City of Los Angeles Municipal Code establishes when construction work is prohibited. The Municipal Code section states the following:

(a) *No person shall between the hours of 9:00 p.m. and 7:00 a.m. of the following day perform any construction or repair work of any kind upon or any excavating for, any building or structure, where any of the foregoing entails the use of any power-driven drill, driven machine, excavator, or any other machine, tool, device, or equipment which makes loud noises to the disturbance of persons occupying sleeping quarters in any dwelling, hotel, or apartment or other place of residence. In addition, the operation, repair or servicing of construction equipment and the jobsite delivering of construction materials in such areas shall be prohibited during the hours herein specified. Any person who knowingly and willfully violates the foregoing provision shall be deemed guilty of a misdemeanor punishable as elsewhere provided in this code.*
The code section also provides certain provisions for exceptions and exemptions.

Chapter 11 of the Municipal Code sets forth noise regulations, including regulations applicable to construction noise impacts. Section 112.05 establishes maximum noise levels for powered equipment or powered hand tools. This section states:

Between the hours of 7:00 a.m. and 10:00 p.m. in any residential zone of the City or within 500 ft thereof, no person shall operate or cause to be operated any powered equipment or powered hand tool that produces a maximum noise level exceeding the following noise limits at a distance of 50 ft therefrom:

- (a) 75 dBA for construction, industrial and agricultural machinery including crawler tractors, dozers, rotary drills and augers, loaders, power shovels, cranes, derricks, motor graders, paving machines, off-highway trucks, ditchers, trenchers, compactors, scrapers, wagons, pavement breakers, depressors, and pneumatic or other powered equipment;
- (b) 75 dBA for powered equipment of 20 horsepower or less intended for infrequent use in residential areas including chain saws, log chippers, and powered hand tools; and
- (c) 65 dBA for powered equipment intended for repetitive use in residential areas including lawn mowers, backpack mowers, small lawn and garden tools, and riding tractors.

The noise limits for particular equipment listed above in (a), (b) and (c) shall be deemed to be superseded and replaced by noise limits for such equipment from and after their establishment by final regulations adopted by the Federal Environmental Protection Agency and published in the Federal Register.

Said noise limitations shall not apply where compliance therewith is technically infeasible. The burden of proving that compliance is technically infeasible shall be upon the person or persons charged with a violation of this section. Technical infeasibility shall mean that said noise limitations cannot be complied with despite the use of mufflers, shields, sound barriers, and/or other noise reduction device and techniques during the operation of the equipment.

Section 112.04 of the Municipal Code addresses the “powered equipment intended for repetitive use in residential areas and other machinery, equipment, and devices.” That section establishes criteria for stationary noise source intrusion on neighboring lands. The applicable standard threshold under this section is a 5 dBA increase at any sensitive property.
3.11.4 Impacts and Mitigation Measures

3.11.4.1 Methodology

3.11.4.1.1 CEQA Baseline

Section 15125 of the CEQA Guidelines requires EIRs to include a description of the physical environmental conditions in the vicinity of a project that exist at the time of the NOP. These environmental conditions normally would constitute the baseline physical conditions by which the CEQA lead agency determines if an impact is significant. For purposes of this Draft EIS/EIR, the CEQA baseline for determining the significance of potential Project impacts is the environmental set of conditions that prevailed at the time the NOP was published for the proposed Project - July 2009. The CEQA baseline takes into account the throughput for the 12-month period preceding July 2009 (July 2008 through the end of June 2009) in order to provide a representative characterization of activity levels throughout the year. The CEQA baseline conditions are described in Section 2.6.1. The CEQA baseline for this proposed Project includes approximately 1.13 million TEUs per year, 998,728 annual truck trips, and 247 annual ship calls that occurred on the 291-acre APL Terminal in the year prior to and including June 2009.

The CEQA baseline represents the setting at a fixed point in time and differs from the No Project Alternative (Alternative 1) in that the No Project Alternative addresses what is likely to happen at the proposed Project site over time, starting from the existing conditions. Therefore, the No Project Alternative allows for growth at the proposed Project site that could be expected to occur without additional approvals, whereas the CEQA baseline does not.

3.11.4.1.2 NEPA Baseline

For purposes of this Draft EIS/EIR, the evaluation of significance under NEPA is defined by comparing the proposed Project or other alternative to the NEPA baseline. The NEPA baseline conditions are described in Section 2.6.2. Briefly, the NEPA baseline condition for determining significance of impacts includes the full range of construction and operational activities the applicant could implement and is likely to implement absent a federal action, in this case the issuance of a USACE permit. The NEPA baseline includes minor terminal improvements in the upland area (i.e., conversion of a portion of the dry container storage unit area to reefers and utility infrastructure), operation of the 291-acre container terminal, and assumes that by 2027, the terminal (Berths 302 to 305) handles up to approximately 2.15 million TEUs annually and accommodates 286 annual ships calls and 2,336 on-way rail trips, without any federal action. Because the NEPA baseline is dynamic, it includes different levels of terminal operations at each study year (2012, 2015, 2020, 2025, and 2027).

Unlike the CEQA baseline, which is defined by conditions at a point in time, the NEPA baseline is not bound by statute to a “flat” or “no-growth” scenario. Therefore, the USACE could project increases in operations over the life of a project to properly describe the NEPA baseline condition. Normally, any federal permit decision would focus on direct impacts of the proposed Project to the aquatic environment, as well as indirect and cumulative impacts in the uplands determined to be within the scope of federal control and responsibility. Significance of the proposed Project or alternative
under NEPA is defined by comparing the proposed Project or alternative to the NEPA baseline (i.e., the increment).

The NEPA baseline, for purposes of this Draft EIS/EIR, is the same as the No Federal Action Alternative. Under the No Federal Action Alternative, only minor terminal improvements (utility infrastructure, and conversion of dry container storage to refrigerated container storage) would occur, but no new cranes would be added, and the terminal configuration would remain as it was configured in 2008 (291 acres, 12 A-frame cranes, and a 4,000-ft wharf). However, forecasted increases in cargo throughput and annual ship calls would still occur as container growth occurs.

### 3.11.4.2 Thresholds of Significance

The *L.A. CEQA Thresholds Guide* (City of Los Angeles, 2006) contains the following significance thresholds related to construction noise. These thresholds were used for evaluating potential impacts under CEQA and NEPA. Quantification of ambient noise levels (existing and projected at the time of construction) is measured in CNEL.

A project or alternative would normally have a significant impact on noise levels from construction during the *daytime* if:

**NOI-1** Construction activities lasting more than 1 day would exceed existing ambient exterior noise levels by 10 dBA or more at a noise-sensitive use; or if construction activities lasting more than 10 days in a 3-month period would exceed existing ambient exterior noise levels by 5 dBA or more at a noise-sensitive use.

A project or alternative would normally have a significant impact on noise levels from construction during the *nighttime* if:

**NOI-2** Construction activities would exceed the ambient noise level by 5 dBA at a noise-sensitive use between the hours of 9:00 p.m. and 7:00 a.m. Monday through Friday, before 8:00 a.m. or after 6:00 p.m. on Saturday, or at any time on Sunday.

The *L.A. CEQA Thresholds Guide* (City of Los Angeles, 2006) contains the following significance thresholds for operational noise impacts due to stationary sources, vehicular traffic, or increased railroad operations.

**NOI-3** A project or alternative would normally have a significant impact on noise levels from project operations if the project causes the ambient noise level measured at the property line of affected uses to increase by 3 dBA in CNEL to or within the ‘normally unacceptable’ or ‘clearly unacceptable category,’ or any 5 dBA or greater noise increase.

Table 3.11-4 presents the land use noise compatibility guidelines.

Sensitive receivers in the Port area that could potentially be affected by operational noise from the proposed Project or alternative include various residential uses. At these land uses, a significant impact would occur if the proposed Project or alternative causes CNEL noise levels to increase by (1) 5 dBA or greater where the existing CNEL is less than 70 dBA; or (2) 3 dBA or greater where the existing CNEL exceeds 70 dBA.

*Normally Acceptable*: Specified land use is satisfactory, based on the assumption that any buildings involved are of normal conventional construction without any special noise insulation requirements.

*Conditionally Acceptable*: New construction or development should be undertaken only after a detailed analysis of the noise reduction requirements is made and needed noise insulation features included in the design. Conventional construction, but with closed windows and fresh air supply systems or air conditioning, will normally suffice.

*Normally Unacceptable*: New construction or development generally should be discouraged. If new construction or development does proceed, a detailed analysis of the noise reduction requirements must be made and needed noise insulation features included in the design.

*Clearly Unacceptable*: New construction or development generally should not be undertaken.

3.11.4.3 Impact Determination

3.11.4.3.1 Proposed Project

**Impact NOI-1:** Construction activities lasting more than 10 days in a 3-month period would exceed existing ambient exterior noise levels by 5 dBA or more at a noise-sensitive use.

Noise levels generated by construction equipment will vary greatly depending on factors such as the type of equipment, the specific model, the operation being performed, and the condition of the equipment. The equivalent sound level ($L_{eq}$) of the construction activity also depends on the fraction of time that the equipment is operated over the time period of construction. The dominant source of noise from most construction equipment is the engine. In a few cases, such as impact pile driving or pavement-breaking, noise generated by the process dominates.

Table 3.11-5 shows the noise levels for a variety of construction equipment at a reference distance of 50 ft. These reference sound levels are representative of the noise levels that would occur during the noisiest construction activities. Should automated backlands be established, the level of construction activity to complete those improvements would be less intense (i.e., would not involve pile driving or occur concurrently with other on-site construction activities) as compared to the construction levels discussed in the impact analysis for the proposed Project, and thus would not represent the noisiest construction activity.

During construction, the overall average noise levels vary with the level of construction activity, the types of equipment that are on-site and operating at a particular time, and the proximity of the construction equipment to noise sensitive land uses. Hourly average noise levels are estimates based on a typical complement of construction equipment that would be expected to be on-site to complete the various proposed Project components.

* POLA, November 2008

Construction activities are expected to last more than 10 days in any 3-month period for all proposed Project components. Following the thresholds of significance, an impact would be considered significant under CEQA and NEPA if noise from these activities would cause the existing ambient exterior noise levels to increase by 5 dBA or more at a sensitive receptor.

During peak construction, construction worker based vehicle trips are expected to represent a small fraction (1 to 10 percent) of the AM and PM peak hour traffic volumes in the Project area. This small fraction of vehicles compared to the overall traffic in the Project area would not result in a noticeable increase in noise levels (a doubling of traffic would be required for a minimally audible 3 dBA increase in noise to occur). Therefore, traffic generated from construction worker trips would be considered a less than significant impact.
To assess construction noise exposure at noise sensitive locations, a composite of the noise level data for construction equipment presented in Table 3.11-5 was used to develop resulting noise levels at identified noise-sensitive receptors, taking into consideration the effects of distance attenuation. For general construction equipment, a combined level of 91 dBA at 50 ft was used as the source noise level. For assessing pile driving, a noise level of 107 dBA at 50 ft was used based on the large size of piles typically used for wharf construction. Distances from construction locations to sensitive receptors were measured on a map of the area and those distances were input to the Federal Highway Administration (FHWA) Roadway Construction Noise Model (RCNM) as the basis for calculating noise attenuation with distance (FHWA, 2008). This model provides for multiple noise sources, as well as shielding by natural or man-made obstacles that would reduce sound levels over distance. However, no shielding was assumed, even though there are obstacles of various types (buildings, other structures, tanks, etc.) between some source locations and some receptors.

Using the FHWA noise model, which calculates an Leq based on reference noise levels, all five identified noise sensitive areas in the Project vicinity were assessed for exposure to construction noise. These areas and the resultant Leq are summarized in Table 3.11-6 below.

</tbody>
</table>

Notes: * the reference noise level of 91 dBA or 107 dBA at 50 ft from the source.

Total Amb + Impact is the ambient noise condition plus the pile driving (i.e. impact) noise at the given receptor location.

### CEQA Impact Determination

As shown in Table 3.11-6, general construction noise would not increase the existing ambient noise levels at any identified noise receptor in the proposed Project area by 5 dBA or more; however, noise produced by pile driving during wharf construction would increase average ambient noise levels at Reservation Point by 5 dBA over existing levels. These impacts would be temporary, but significant under CEQA.

### Mitigation Measures

#### MM NOI-1: Noise Reduction during Pile Driving. The contractor shall be required to use a pile driving system, such as a Bruce hammer (with silencing kit), an IHC Hydrohammer SC series (with sound insulation system), or equivalent silenced hammer, which is capable of limiting maximum noise levels at 50 ft from the pile driver to 104 dBA, or less, for wharf construction. With implementation of standard condition of approval SC BIO-1, the pile driving would initiate with a soft start, in which the hammer is operated at a reduced energy, followed by a
Waiting period. The soft start technique would induce marine mammals and birds to leave the immediate area before pile hammer reaches full energy. Refer to Section 3.3, Biological Resources, for information on soft start of pile driving activities.

**MM NOI-2: Erect Temporary Noise Attenuation Barriers Adjacent to Pile Driving Equipment, Where Necessary and Feasible.** Erect temporary noise attenuation barriers suitable for pile driving equipment as needed. The barriers should be installed directly between the equipment and the nearest noise sensitive use to the construction site. The need for and feasibility of noise attenuation barriers should be evaluated on a case-by-case basis considering the distance to noise sensitive receptors, the available space at the construction location, and taking account of safety and operational considerations.

*Residual Impacts*
Impacts would be less than significant.

**NEPA Impact Determination**
As shown in Table 3.11-6, general construction noise would not increase the existing ambient noise levels at any identified receptor in the proposed Project area by 5 dBA or more; however, noise produced by pile driving during wharf construction would increase average ambient noise levels at Reservation Point by 5 dBA over existing levels. These impacts would be temporary in nature, but considered significant under NEPA.

*Mitigation Measures*
Mitigation measures MM NOI-1 and MM NOI-2 would be implemented.

*Residual Impacts*
Impacts would be less than significant.

**Impact NOI-2: Noise levels from construction activities would not exceed the ambient noise level by 5 dBA at a noise-sensitive use between the hours of 9:00 p.m. and 7:00 a.m. Monday through Friday, before 8:00 a.m. or after 6:00 p.m. on Saturday, or at any time on Sunday.**

With the exception of dredging along Berth 306, the proposed Project would follow construction hours in accordance with the City of Los Angeles Noise Ordinance. Berth 306 is located over one mile from the nearest sensitive receptor (liveaboards at the Al Larson Marina in Fish Harbor and Reservation Point), and accordingly, no construction activities within 500 ft of a residential zone would occur between the hours of 9:00 p.m. and 7:00 a.m. Monday through Friday, before 8:00 a.m. or after 6:00 p.m. on Saturday, or at any time on Sunday. Night construction during dredging of Berth 306 would result in average noise levels which exceed the ambient levels at the Fish Harbor liveaboards or Reservation Point; however, the increases would be less than 2 dBA, and thus would not exceed the significance criteria at these locations.
CEQA Impact Determination

There would be no construction-related noise impacts during prohibited nighttime hours. As a result, there would be no significant impact related to Impact NOI-2 under CEQA.

Mitigation Measures

No mitigation is required.

Residual Impacts

Impacts would be less than significant.

NEPA Impact Determination

With the exception of dredging along Berth 306, the proposed Project would follow construction hours in accordance with the City of Los Angeles Noise Ordinance. Berth 306 is located over one mile from the nearest sensitive receptor (liveaboards at the Al Larson Marina in Fish Harbor and Reservation Point), and accordingly, no construction activities would occur within 500 ft of a residential zone between the hours of 9:00 p.m. and 7:00 a.m. Monday through Friday, before 8:00 a.m. or after 6:00 p.m. on Saturday, or at any time on Sunday. Night construction during dredging of Berth 306 would result in average noise levels which exceed the ambient levels at the Fish Harbor liveaboards or Reservation Point; however, the increases would be less than 2 dBA, and thus would not exceed the significance criteria at these locations. As a result, construction noise impacts under the proposed Project would be less than significant under NEPA.

Mitigation Measures

No mitigation is required.

Residual Impacts

Impacts would be less than significant.

Impact NOI-3: Operations would not generate noise levels that exceed existing ambient noise levels at sensitive receivers by 3 dBA in CNEL to or within the ‘normally unacceptable’ or ‘clearly unacceptable category,’ or otherwise by 5 dBA or greater.

CEQA Impact Determination

On-site terminal and dock operational noise sources associated with the proposed Project would include the intermittent sounds of operations, such as gantry cranes offloading and loading containers, rail and truck movements, and ongoing Port-related maintenance activities at the expanded Power Shop facility. ST-5 measured noise during the unloading of cargo ships by gantry cranes along with truck movements on the existing Evergreen Terminal at a distance of 1,200 ft from the terminal activities, and is considered to be representative of operating noise for the proposed Project operations. With the exception of the proposed backland “meet and greet” facility at Berth 301 (which is not expected to constitute a significant source of noise), all proposed Project-related operational activities would be more than 1,200 ft from the closest noise sensitive receptors (i.e., LT-2: liveaboards at Fish Harbor) and are expected to produce noise levels less than those documented at measurement site ST-5, with noise levels from Project operation, occasionally reaching to low to mid-50 dBA.
range at the closest receptors. This level of noise would increase noise levels at these
adjacent noise sensitive uses by less than 3 dBA, and would not result in a significant impact
at any adjacent noise sensitive uses (see Table 3.11-7). Should it occur, operational noise
associated with automated operations on the backlands is anticipated to be similar or less than
would occur under traditional operations and thus would not result in a significant impact
under CEQA.

Note: ¹ Noise levels are referenced to 1200 ft from the center of the operational source and are based on measurements made at Location ST-5.

Proposed Project implementation would result in increased container shipments to and
from the Port via area rail and roadway corridors, along with increased workforce
automobile traffic on area roadways. The proposed Project would result in
3,003,157 annual one-way truck trips and 2,953 annual rail trips (829 off dock and
2,125 on-dock rail trips) by 2027. All on-dock rail trips leave the proposed Project site
(on Terminal Island) over the Henry Ford Bridge (also known as the Badger Avenue
Bridge). Based on this, and considering that the percentage proposed Project-generated
on-dock rail traffic would lessen as the rail network spreads out from the Port, the Island
Yacht Anchorage liveaboards in the Cerritos Channel have been identified as the noise
sensitive use with the greatest potential to be impacted by increases in Project-generated
rail noise. The increase in proposed Project only on-dock rail trips over the CEQA
baseline for the Project would result in a 2 dBA increase in the CNEL at the Island Yacht
Anchorage liveaboards in the Cerritos Channel from the baseline level of 77 dBA CNEL
to a CNEL of 79 dBA by 2027. Therefore, rail trips generated by terminal operations
under the proposed Project would not result in a significant noise impact under CEQA.

A review and comparison of automobile and truck traffic data for area roadways under
existing 2008 conditions (CEQA baseline) and CEQA Baseline conditions plus proposed
Project conditions for years 2015, 2020, 2025 and 2027 indicates that the proposed
Project-related increases in automobile or truck traffic on area roadways (in each of these
years) over the existing 2008 conditions would result in noise levels at adjacent noise
sensitive uses of less than 3 dBA, and would not result in a significant impact at any
adjacent noise sensitive uses under CEQA.

Mitigation Measures

No mitigation is required.

Residual Impacts

Impacts would be less than significant.
NEPA Impact Determination

Roadway noise from an increase in automobile and truck traffic under future proposed Project conditions would be the same as described under the CEQA Impact Determination. However, the NEPA baseline noise levels generally would be higher than the CEQA baseline noise levels as shown in Table 3.11-7 because the NEPA baseline allows for terminal operational growth and completion of improvements not requiring a USACE permit. Therefore, the traffic levels resulting from Project-related terminal activities would increase noise levels at the adjacent noise sensitive uses by less than 3 dBA (relative to the NEPA baseline), and would not result in a significant impact at any adjacent noise sensitive uses under NEPA.

Proposed Project implementation would result in increased container shipments to and from the Port via area rail and roadway corridors, along with increased workforce automobile traffic on area roadways. All on-dock rail trips leave the proposed Project site (on Terminal Island) over the Henry Ford Bridge (also known as the Badger Avenue Bridge). Based on this, and considering that the percentage proposed Project-generated on-dock rail traffic would lessen as the rail network spreads out from the Port, the Island Yacht Anchorage liveaboards in the Cerritos Channel have been identified as the noise sensitive use with the greatest potential to be impacted by increases in proposed Project-generated rail noise. The increase in proposed Project only on-dock rail traffic train trips over the NEPA baseline would result in a 1 dBA increase in the CNEL at the Island Yacht Anchorage liveaboards in the Cerritos Channel, from a level of 78 dBA CNEL under the 2027 NEPA baseline to a level of 79 dBA CNEL for proposed Project conditions in 2027. Therefore, rail trips generated by terminal operations under the proposed Project would not result in a significant noise impact under NEPA.

A review and comparison of automobile and truck traffic data for area roadways with the proposed Project and NEPA baseline conditions indicates that proposed Project-related increases in automobile or truck traffic on area roadways would increase noise levels at adjacent noise sensitive uses by 2 dBA or less, and would therefore, not result in a significant impact at any adjacent noise sensitive uses under NEPA.

Mitigation Measures

No mitigation is required.

Residual Impacts

Impacts would be less than significant.

3.11.4.3.1.1 Alternatives

3.11.4.3.1.2 Alternative 1 – No Project

Under Alternative 1, no further Port action or federal action would occur. The Port would not construct and develop additional backlands, wharves, or terminal improvements. No new cranes would be added, no gate or backland improvements would occur, and no infrastructure for AMP at Berth 306 or automation in the backland area adjacent to Berth 306 would be provided. This alternative would not include any dredging, new wharf construction, or new cranes. The No Project Alternative would not include development of any additional backlands because the existing terminal is berth-constrained and additional backlands would not improve its efficiency.
Under the No Project Alternative, the existing APL Terminal would continue to operate as an approximately 291-acre container terminal. Based on the throughput projections, terminal operations are expected to grow over time as throughput demands increase.

Under Alternative 1, the existing APL Terminal would handle approximately 2.15 million TEUs by 2027, which would result in 286 annual ship calls at Berths 302-305. In addition, this alternative would result in up to 7,273 peak daily one-way truck trips (1,922,497 annual), and up to 2,336 annual one-way rail trip movements. Under Alternative 1, cargo ships that currently berth and load/unload at the Berths 302-305 terminal would continue to do so.

The No Project Alternative would not preclude future improvements to the proposed site. However, any future changes in use or new improvements with the potential to significantly impact the environment would need to be analyzed in a separate environmental document.

**Impact NOI-1:** Construction activities lasting more than 10 days in a 3-month period would not exceed existing ambient exterior noise levels by 5 dBA or more at a noise-sensitive use.

There would be no construction activities for this alternative.

**CEQA Impact Determination**
Alternative 1 would not involve any construction activities and, therefore, there would be no potential for impacts under CEQA.

*Mitigation Measures*
No mitigation is required.

*Residual Impacts*
There would be no impacts.

**NEPA Impact Determination**
The impacts of the No Project Alternative are not required to be analyzed under NEPA. NEPA requires the analysis of a No Federal Action Alternative (Alternative 2 in this document).

*Mitigation Measures*
Mitigation measures are not applicable.

*Residual Impacts*
An impact determination is not applicable.
Impact NOI-2: Noise levels from construction activities would not exceed the ambient noise level by 5 dBA at a noise-sensitive use between the hours of 9:00 p.m. and 7:00 a.m. Monday through Friday, before 8:00 a.m. or after 6:00 p.m. on Saturday, or at any time on Sunday.

CEQA Impact Determination
Alternative 1 would not involve any construction activities and, therefore, no nighttime construction-related impacts would occur. There would be no potential for impacts under CEQA.

Mitigation Measures
No mitigation is required.

Residual Impacts
There would be no impacts.

NEPA Impact Determination
The impacts of the No Project Alternative are not required to be analyzed under NEPA. NEPA requires the analysis of a No Federal Action Alternative (Alternative 2 in this document).

Mitigation Measures
Mitigation measures are not applicable.

Residual Impacts
An impact determination is not applicable.

Impact NOI-3: Operations would not generate noise levels that exceed existing ambient noise levels at sensitive receivers by 3 dBA in CNEL to or within the ‘normally unacceptable’ or ‘clearly unacceptable category,’ or otherwise by 5 dBA or greater.

For Alternative 1, the site would continue to operate as container terminal. On-site terminal and dock operational noise sources associated with this alternative would include the intermittent sounds of operations, such as gantry cranes offloading and loading containers, rail and truck movements, and other ongoing Port activities. All such Alternative 1-related activities would be more than 1,200 ft from the closest noise sensitive receptors (i.e. liveaboards at Fish Harbor) and are expected to produce noise levels less than those documented at measurement site ST-5, with noise levels from terminal operations occasionally reaching to low to mid-50 dBA range. As with the proposed Project, noise levels at adjacent noise sensitive uses under Alternative 1 would increase by less than 3 dBA, and would not result in a significant impact at any adjacent noise sensitive uses (see Table 3.11-7).
**CEQA Impact Determination**

Under Alternative 1, increases on container shipments to and from the Port via area rail and roadway corridors, and workforce automobile traffic on area roadways would occur relative to the CEQA baseline conditions. However these increases would be less than under proposed Project conditions, and would result in CNEL increases of less than 3 dBA at sensitive receivers in the Port area. Therefore, no significant noise impact at adjacent noise sensitive uses due to terminal operations under Alternative 1 would occur under CEQA.

*Mitigation Measures*

No mitigation is required.

*Residual Impacts*

Impacts would be less than significant.

**NEPA Impact Determination**

The impacts of the No Project Alternative are not required to be analyzed under NEPA. NEPA requires the analysis of a No Federal Action Alternative (Alternative 2 in this document).

*Mitigation Measures*

Mitigation measures are not applicable.

*Residual Impacts*

An impact determination is not applicable.

**3.11.4.3.1.3 Alternative 2 – No Federal Action**

The No Federal Action Alternative would be the same as the NEPA baseline and would include only the activities and impacts likely to occur absent further USACE federal approval but could include improvements that require a local action. Under Alternative 2, no federal action would occur; however, minor terminal improvements in the upland area of the existing APL Terminal would be implemented. These minor upland improvements would include conversion of a portion of the dry container storage area to an additional 200 reefers, associated electrical lines, and installation of utility infrastructure at locations in the existing backland areas. Beyond these minor upland improvements, the Port would not construct and develop additional backlands or wharves. No gate or additional backland improvements would occur, and no in-water features such as dredging or a new berth, wharf extension, or over-water features such as new cranes would occur under the No Federal Action Alternative.

Under the No Federal Action Alternative, the existing APL Terminal would continue to operate as an approximately 291-acre container terminal, and up to approximately 2.15 million TEUs could be handled at the terminal by 2027. Based on the throughput projections, the No Federal Action Alternative would result in 286 annual ship calls at Berths 302-305. In addition, this alternative would result in up to 7,273 peak daily truck trips (1,922,497 annual), and up to 2,336 annual one-way rail trip movements. Cargo ships that currently berth and load/unload at the Berths 302-305 terminal would continue to do so.
Impact NOI-1: Construction activities lasting more than 10 days in a 3-month period would not exceed existing ambient exterior noise levels by 5 dBA or more at a noise-sensitive use.

Alternative 2 would involve terminal improvements in the upland area, but would not construct and develop additional backlands or wharves. With this alternative the general construction noise levels shown in Table 3.11-6 may occur, however no pile driving noise would occur.

CEQA Impact Determination

General construction noise would not increase the existing ambient noise levels at any identified noise receptor in the Project area by 5 dBA or more, and therefore, no significant impacts due to construction would occur under CEQA.

Mitigation Measures

No mitigation is required.

Residual Impacts

Impacts would be less than significant.

NEPA Impact Determination

The No Federal Action Alternative would have the same conditions as the NEPA baseline, as explained in Section 2.6.2 in Chapter 2; therefore, there is no incremental difference between Alternative 2 and the NEPA baseline. As a consequence, Alternative 2 would result in no impact under NEPA.

Mitigation Measures

No mitigation is required.

Residual Impacts

There would be no impacts.

Impact NOI-2: Noise levels from construction activities would not exceed the ambient noise level by 5 dBA at a noise-sensitive use between the hours of 9:00 p.m. and 7:00 a.m. Monday through Friday, before 8:00 a.m. or after 6:00 p.m. on Saturday, or at any time on Sunday.

Construction activities for this alternative would not be conducted during nighttime hours.

CEQA Impact Determination

No nighttime construction-related impacts would occur; therefore, there would be no impacts under CEQA.
Mitigation Measures

No mitigation is required.

Residual Impacts

There would be no impacts.

NEPA Impact Determination

The No Federal Action Alternative would have the same conditions as the NEPA baseline, as explained in Section 2.6.2 in Chapter 2; therefore, there would be no incremental difference between Alternative 2 and the NEPA baseline. As a consequence, Alternative 2 would result in no impact under NEPA.

Mitigation Measures

No mitigation is required.

Residual Impacts

There would be no impacts.

Impact NOI-3: Operations would not generate noise levels that exceed existing ambient noise levels at sensitive receivers by 3 dBA in CNEL to or within the ‘normally unacceptable’ or ‘clearly unacceptable category,’ or otherwise by 5 dBA or greater.

CEQA Impact Determination

For Alternative 2, the site would continue to operate as container terminal. On-site terminal and dock operational noise sources associated with this alternative would include the intermittent sounds of operations, such as gantry cranes offloading and loading containers, rail and truck movements, and other ongoing Port activities. All such Alternative 2-related activities would be more than 1,200 ft from the closest noise sensitive receptors (i.e., liveaboards at Fish Harbor) and are expected to produce noise levels less than those documented at measurement site ST-5, with noise levels from terminal operations occasionally reaching to low to mid-50 dBA range. As with the proposed Project, noise levels at adjacent noise sensitive uses under Alternative 2 would increase by less than 3 dBA, and would not result in a significant impact at any adjacent noise sensitive uses (see Table 3.11-7) under CEQA.

Under Alternative 2, increases on container shipments to and from the Port via area rail and roadway corridors, and workforce automobile traffic on area roadways would occur relative to the CEQA baseline conditions. However these increases would be less than under proposed Project conditions, and result in CNEL increases of less than 3 dBA at sensitive receivers in the Port area. Therefore, no significant noise impact at adjacent noise sensitive uses due to terminal operations under Alternative 2 would occur under CEQA.
Mitigation Measures
No mitigation is required.

Residual Impacts
Impacts would be less than significant.

NEPA Impact Determination
The No Federal Action Alternative would have the same conditions as the NEPA baseline, as explained in Section 2.6.2 in Chapter 2; therefore, there would be no incremental difference between Alternative 2 and the NEPA baseline. As a consequence, Alternative 2 would result in no impact under NEPA.

Mitigation Measures
No mitigation is required.

Residual Impacts
There would be no impacts.

3.11.4.3.1.4 Alternative 3 – Reduced Project: Four New Cranes
Under Alternative 3, four new cranes would be added to the existing wharf along Berths 302-305 and only minor improvements to the existing APL Terminal would be made (utility infrastructure and conversion of dry container storage to reefers). No other upland terminal improvements would be constructed. The existing terminal is berth-constrained, and adding the additional four cranes would improve the terminal’s efficiency.

The total acreage of backlands under Alternative 3 would remain at approximately 291 acres, which would be less than the proposed Project. This alternative would not include the extension of the existing wharf, construction of a new berth, dredging, or the relocation and improvement of various gates and entrance lanes.

Based on the throughput projections, TEU throughput under Alternative 3 would be less than the proposed Project, with an expected throughput of approximately 2.58 million TEUs by 2027. This would translate into 338 annual ship calls at Berths 302-305. In addition, this alternative would result in up to 8,725 peak daily truck trips (2,306,460 annual), and up to 2,544 annual one-way rail trip movements. Configuration of all other landside terminal components would be identical to the existing terminal.

Impact NOI-1: Construction activities lasting more than 10 days in a 3-month period would not exceed existing ambient exterior noise levels by 5 dBA or more at a noise-sensitive use.

Alternative 3 would add four cranes to the existing wharf along Berths 302-305, and only minor improvements to the existing APL Terminal would be made. With this alternative, the general construction noise levels shown in Table 3.11-6 may occur; however, no pile driving noise would occur.
CEQA Impact Determination

General construction noise would not increase the existing ambient noise levels at any identified noise receptor in the Project area by 5 dBA or more, and therefore, no significant impacts due to construction would occur under this alternative under CEQA.

Mitigation Measures
No mitigation is required.

Residual Impacts
Impacts would be less than significant.

NEPA Impact Determination

General construction noise levels shown in Table 3.11-6 may occur; however, no pile driving noise would occur. General construction noise would not increase the existing ambient noise levels at any identified noise receptor in the Project area by 5 dBA or more, and therefore, no significant impacts due to construction would occur under NEPA.

Mitigation Measures
No mitigation is required.

Residual Impacts
Impacts would be less than significant.

Impact NOI-2: Noise levels from construction activities would not exceed the ambient noise level by 5 dBA at a noise-sensitive use between the hours of 9:00 p.m. and 7:00 a.m. Monday through Friday, before 8:00 a.m. or after 6:00 p.m. on Saturday, or at any time on Sunday.

Construction activities for this alternative would not be conducted during nighttime hours.

CEQA Impact Determination

No nighttime construction-related impacts would occur; therefore, there is no potential for impacts under CEQA.

Mitigation Measures
No mitigation is required.

Residual Impacts
There would be no impacts.
NEPA Impact Determination

Construction activities for this alternative would not be conducted during nighttime hours; therefore, no nighttime construction-related impacts would occur under NEPA.

**Mitigation Measures**

No mitigation is required.

**Residual Impacts**

There would be no impacts.

**Impact NOI-3:** Operations would not generate noise levels that exceed existing ambient noise levels at sensitive receivers by 3 dBA in CNEL to or within the ‘normally unacceptable’ or ‘clearly unacceptable category,’ or otherwise by 5 dBA or greater.

CEQA Impact Determination

With the addition of four new cranes and increased throughput handling at the terminal, operational noise levels would increase. All such activities would be more than 1,200 ft from the closest noise sensitive receptors (i.e. liveaboards at Fish Harbor) and are expected to produce noise levels less than those documented at measurement site ST-5, with noise levels from Alternative 3 operations occasionally reaching low to mid-50 dBA range. As with the proposed Project, the level of noise under Alternative 3 would increase noise levels at the adjacent noise sensitive uses by less than 3 dBA, and would not result in a significant impact at any adjacent noise sensitive uses (see Table 3.11-7) under CEQA.

Although Alternative 3 would result in an increase in automobile, truck, and rail traffic on area rail and roadway corridors, these increases would be less than under proposed Project conditions. As a consequence, Alternative 3 operations would not result in CNEL increases of 3 dBA or more at sensitive receivers in the Port area. Therefore, no significant noise impact would occur at adjacent noise sensitive uses due to terminal operations under Alternative 3 under CEQA.

**Mitigation Measures**

No mitigation is required.

**Residual Impacts**

Impacts would be less than significant.

NEPA Impact Determination

Roadway noise from an increase in automobile and truck traffic under Alternative 3 future conditions would be the same as described under the CEQA Impact Determination. However, the NEPA baseline noise levels generally would be higher than the CEQA baseline noise levels shown in Table 3.11-7 because the NEPA baseline allows for terminal operational growth due to completion of improvement not requiring a USACE permit. Therefore, the traffic levels resulting from Alternative 3 terminal activities would increase noise levels at the noise sensitive uses by less than 3 dBA (relative to the NEPA
baseline), and would not result in a significant impact at any adjacent noise sensitive uses under NEPA.

Although Alternative 3 would result in increased automobile, truck, and rail traffic on area rail and roadway corridors, these increases would be less than under proposed Project conditions. All on-dock rail trips leave the proposed site (on Terminal Island) over the Henry Ford Bridge (also known as the Badger Avenue Bridge). Based on this, and considering that the percentage of Alternative 3-generated on-dock rail traffic would lessen as the rail network spreads out from the Port, the Island Yacht Anchorage liveaboards in the Cerritos Channel have been identified as the noise sensitive use with the greatest potential to be impacted by increases in rail noise generated by Alternative 3-generated rail noise. The increase in on-dock rail traffic train trips for Alternative 3 over the NEPA baseline would result in a 1 dBA increase in the CNEL at the Island Yacht Anchorage liveaboards in the Cerritos Channel, from a level of 78 dBA CNEL under the 2027 NEPA baseline to a level of 79 dBA CNEL for Alternative 3 conditions in 2027. Therefore, rail trips generated by terminal operations under Alternative 3 would not result in a significant noise impact.

A review and comparison of automobile and truck traffic data for area roadways with the Alternative 3 and NEPA baseline conditions indicates that Alternative 3-related increases in automobile or truck traffic on area roadways would increase noise levels at adjacent noise sensitive uses by 2 dBA or less, and would therefore, not result in a significant impact at any adjacent noise sensitive uses under NEPA.

Mitigation Measures
No mitigation is required.

Residual Impacts
Impacts would be less than significant.

3.11.4.3.1.5 Alternative 4 – Reduced Project: No New Wharf

Under Alternative 4, six cranes would be added to the existing terminal wharf at Berths 302-305, and the 41-acre fill area adjacent to the APL Terminal would be developed as container yard backlands. EMS would relinquish the 30 acres of backlands under space assignment. EMS would not add the nine acres of land behind Berth 301 or the two acres at the main gate to its permit. Because no new wharf would be constructed at Berth 306, the 41-acre backland would be operated using traditional methods and would not be expected to transition to use of automated equipment. As the existing wharf would not be extended to create Berth 306, no dredging would occur.

Under Alternative 4, the total terminal acreage would be 302 acres, which is less than the proposed Project. Based on the throughput projections, TEU throughput would be less than the proposed Project, with an expected throughput of approximately 2.78 million TEUs by 2027. This would translate into 338 annual ship calls at Berths 302-305. In addition, Alternative 4 would result in up to 9,401 peak daily truck trips (2,485,050 annual), and up to 2,563 annual one-way rail trip movements. Configuration of all other landside terminal components (i.e., Main Gate improvements) would be identical to the proposed Project.
Impact NOI-1: Construction activities lasting more than 10 days in a 3-month period would not exceed existing ambient exterior noise levels by 5 dBA or more at a noise-sensitive use.

Alternative 4 would add six cranes to the existing wharf along Berths 302-305, and no new wharf would be constructed at Berth 306. With this alternative the general construction noise levels shown in Table 3.11-6 may occur; however, no pile driving noise would occur.

CEQA Impact Determination

General construction noise would not increase the existing ambient noise levels at any identified noise receptor in the Project area by 5 dBA or more, and therefore, no significant impacts due to construction would occur under CEQA.

Mitigation Measures

No mitigation is required.

Residual Impacts

Impacts would be less than significant.

NEPA Impact Determination

General construction noise under Alternative 4 would not increase the existing ambient noise levels at any identified noise receptor in the area by 5 dBA or more, and therefore, no significant impacts due to construction would occur under NEPA.

Mitigation Measures

No mitigation is required.

Residual Impacts

Impacts would be less than significant.

Impact NOI-2: Noise levels from construction activities would not exceed the ambient noise level by 5 dBA at a noise-sensitive use between the hours of 9:00 p.m. and 7:00 a.m. Monday through Friday, before 8:00 a.m. or after 6:00 p.m. on Saturday, or at any time on Sunday.

Construction activities for this alternative would not be conducted during nighttime hours.

CEQA Impact Determination

There would be no potential for impacts due to nighttime construction to occur under CEQA.
Mitigation Measures

No mitigation is required.

Residual Impacts

There would be no impacts.

NEPA Impact Determination

There would be no potential for impacts due to nighttime construction to occur under NEPA.

Mitigation Measures

No mitigation is required.

Residual Impacts

There would be no impacts.

Impact NOI-3: Operations would not generate noise levels that exceed existing ambient noise levels at sensitive receivers by 3 dBA in CNEL to or within the ‘normally unacceptable’ or ‘clearly unacceptable category,’ or otherwise by 5 dBA or greater.

CEQA Impact Determination

With the addition of six new cranes and increased cargo throughput-handling at the terminal, operational noise levels would increase. All such activities would be more than 1,200 ft from the closest noise sensitive receptors (i.e. liveaboards at Fish Harbor) and are expected to produce noise levels less than those documented at measurement site ST-5, with noise levels from Alternative 4 operations occasionally reaching to low to mid-50 dBA range. As with the proposed Project, the level of noise under Alternative 4 would increase noise levels at the adjacent noise sensitive uses by less than 3 dBA, and therefore, would not result in a significant impact at any adjacent noise sensitive uses (see Table 3.11-7) under CEQA.

Implementation of Alternative 4 would result in increased container shipments to and from the Port via area rail and roadway corridors, along with increased workforce automobile traffic on area roadways. However, the on-dock rail operations would be less than the proposed Project, and therefore, rail trips generated by terminal operations under Alternative 4 would not result in a significant noise impact at the Island Yacht Anchorage liveaboards in the Cerritos Channel. Although Alternative 4 would result in increased automobile, truck, and rail traffic on area rail and roadway corridors, these increases would be less than under proposed Project conditions. As a consequence, Alternative 4 operations would not result in CNEL increases of 3 dBA at sensitive receivers in the Port area. Therefore, no significant noise impact would occur at adjacent noise sensitive uses due to terminal operations under Alternative 4 under CEQA.
Mitigation Measures

No mitigation is required.

Residual Impacts

Impacts would be less than significant.

NEPA Impact Determination

Roadway noise from an increase in automobile and truck traffic under Alternative 4
future conditions would be the same as described under the CEQA Impact Determination.
However, the NEPA baseline noise levels generally would be higher than the CEQA
baseline noise levels shown in Table 3.11-7 because the NEPA baseline allows for
terminal operational growth due to completion of improvements not requiring a USACE
permit. Therefore, the traffic levels resulting from Alternative 4 related terminal
activities would increase noise levels at the noise sensitive uses by less than 3 dBA
(relative to the NEPA baseline), and would not result in a significant impact at any
adjacent noise sensitive uses under NEPA.

Although Alternative 4 would result in increased automobile, truck, and rail traffic on
area rail and roadway corridors, these increases would be less than under proposed
Project conditions. All on-dock rail trips leave the proposed site (on Terminal Island)
over the Henry Ford Bridge (also known as the Badger Avenue Bridge). Based on this,
and considering that the percentage of Alternative 4-generated on-dock rail traffic would
lessen as the rail network spreads out from the Port, the Island Yacht Anchorage
liveaboards in the Cerritos Channel have been identified as the noise sensitive use with
the greatest potential to be impacted by increases in Alternative 4-generated rail noise.
The increase in on-dock rail traffic train trips for Alternative 4 over the NEPA baseline
would result in a 1 dBA increase in the CNEL at the Island Yacht Anchorage
liveaboards in the Cerritos Channel, from a level of 78 dBA CNEL under the 2027 NEPA baseline to
a level of 79 dBA CNEL for Alternative 4 conditions in 2027. Therefore, rail trips
generated by terminal operations under Alternative 4 would not result in a significant
noise impact under NEPA.

A review and comparison of automobile and truck traffic data for area roadways with
Alternative 4 and NEPA baseline conditions indicates that Alternative 4-related increases
in automobile or truck traffic on area roadways would increase noise levels at adjacent
noise sensitive uses by 2 dBA or less, and would therefore, not result in a significant
impact at any adjacent noise sensitive uses under NEPA.

Under this alternative, there would be increases in automobile, truck, and rail traffic on
area rail and roadway corridors; however, these increases would be less than under
proposed Project conditions, and result in CNEL increases of less than 3 dBA at sensitive
receivers in the Port area. Therefore, Alternative 4 operations would result in no
significant noise impact at adjacent noise sensitive uses under NEPA.

Mitigation Measures

No mitigation is required.

Residual Impacts

Impacts would be less than significant.
3.11.4.3.1.6 Alternative 5 – Reduced Project: No Space Assignment

Alternative 5 would improve the existing terminal, construct a new wharf (1,250 ft) creating Berth 306, add 12 new cranes to Berths 302-306, add 56 acres for backlands, wharfs, and gates improvements, construct electrification infrastructure in the backlands behind Berths 305-306, and relinquish the 30 acres currently on space assignment. This alternative would be the same as the proposed Project, except that EMS would relinquish the 30 acres of backlands under space assignment. As with the proposed Project, the 41-acre backlands and Berth 306 under Alterative 5 could utilize traditional container operations, electric automated operations, or a combination of the two over time.

Dredging of the Pier 300 Channel along the new wharf at Berth 306 (approximately 20,000 cy) would occur, with the dredged material beneficially reused, and/or disposed of at an approved disposal site (such as the CDF at Berths 243-245 and/or Cabrillo shallow water habitat) or, if needed, disposed of at an ocean disposal site (i.e., LA-2).

Under Alternative 5, the total gross terminal acreage would be 317 acres, which is less than the proposed Project. TEU throughput would be the same as the proposed Project, with an expected throughput of approximately 3.2 million TEUs by 2027. This would translate into 390 annual ship calls at Berths 302-306. In addition, this alternative would result in up to 11,361 peak daily truck trips (3,003,157 annual) including drayage, and up to 2,953 annual one-way rail trip movements. Configuration of all other landside terminal components would be identical to the existing terminal.

Impact NOI-1: Construction activities lasting more than 10 days in a 3-month period would exceed existing ambient exterior noise levels by 5 dBA or more at a noise-sensitive use.

Construction noise generated by this alternative would be similar to that generated by the proposed Project, and thus, the noise levels for general construction and pile driving as shown in Table 3.11-6 is applicable to this alternative.

CEQA Impact Determination

General construction noise under this alternative, including construction of infrastructure for backlands automation should that occur, would not increase the existing ambient noise levels at any identified noise receptor in the Project area by 5 dBA or more, but noise produced by pile driving during wharf construction would increase average ambient noise levels at Reservation Point by 5 dBA over existing levels. These impacts would be temporary in nature, but significant under CEQA.

Mitigation Measures

Mitigation measures MM NOI-1 and MM NOI-2 would be implemented.

Residual Impacts

Impacts would be less than significant.

NEPA Impact Determination

General construction noise under this alternative, including construction of infrastructure for backlands automation should that occur, would not increase the existing ambient noise levels at any identified noise receptor in the Project area by 5 dBA or more, but noise produced by pile driving during wharf construction would increase average ambient
noise levels at Reservation Point by 5 dBA over existing levels. These impacts would be
temporary in nature, but significant under NEPA.

Mitigation Measures
Mitigation measures MM NOI-1 and MM NOI-2 would be implemented.

Residual Impacts
Impacts would be less than significant.

Impact NOI-2: Noise levels from construction activities would not exceed the ambient noise level by 5 dBA at a noise-sensitive use between the hours of 9:00 p.m. and 7:00 a.m. Monday through Friday, before 8:00 a.m. or after 6:00 p.m. on Saturday, or at any time on Sunday.

With the exception of dredging along Berth 306, construction activities for this alternative would not be conducted during nighttime hours. Night construction during dredging of Berth 306 would result in average noise levels which exceed the ambient levels at the Fish Harbor liveaboards or Reservation Point; however, the increases would be less than 2 dBA, and thus would not exceed the significance criteria at these locations.

CEQA Impact Determination
Based on the above, construction noise impacts under Alternative 5 would be less than significant under CEQA.

Mitigation Measures
No mitigation is required.

Residual Impacts
Impacts would be less than significant.

NEPA Impact Determination
As discussed above, night construction during dredging of Berth 306 would result in average noise levels which exceed the ambient levels at the Fish Harbor liveaboards or Reservation Point; however, the increases would be less than 2 dBA, and thus would not exceed the significance criteria at these locations. As a result, construction noise impacts under the Alternative 5 would be less than significant under NEPA.

Mitigation Measures
No mitigation is required.

Residual Impacts
Impacts would be less than significant.
Impact NOI-3: Operations would not generate noise levels that exceed existing ambient noise levels at sensitive receivers by 3 dBA in CNEL to or within the ‘normally unacceptable’ or ‘clearly unacceptable category,’ or otherwise by 5 dBA or greater.

CEQA Impact Determination
Operational noise impacts at noise sensitive uses in the Port area under CEQA for Alternative 5 would be the same as those for the proposed Project.

Mitigation Measures
No mitigation is required.

Residual Impacts
Impacts would be less than significant.

NEPA Impact Determination
Operational noise impacts at noise sensitive uses in the Port area under NEPA for Alternative 5 would be the same as those for the proposed Project.

Mitigation Measures
No mitigation is required.

Residual Impacts
Impacts would be less than significant.

3.11.4.3.1.7 Alternative 6 – Proposed Project with Expanded On-Dock Railyard
Alternative 6 would be the same as the proposed Project; however, the existing on-dock railyard on the terminal would be redeveloped and expanded. Under this alternative, approximately 10 acres of backlands would be removed from container storage for the railyard expansion. Alternative 6 would improve the existing terminal, develop the existing 41-acre fill area as backlands, add 1,250 ft of new wharf creating Berth 306, and dredge the Pier 300 Channel along Berth 306. Under this alternative, 12 new cranes would be added to the wharves along Berths 302-306, for a total of 24 cranes. As with the proposed Project, the 41-acre backlands and Berth 306 under Alternative 6 could utilize traditional container operations, electric automated operations, or a combination of the two over time. Dredging of the Pier 300 Channel along Berth 306 would occur (removal of approximately 20,000 cy of material), with the dredged material beneficially reused and/or disposed of at an approved disposal site (such as the CDF at Berths 243-245 and/or Cabrillo shallow water habitat) or, if needed, disposed of at an ocean disposal site (i.e., LA-2). Total terminal acreage (347) would be the same as the proposed Project.

Based on the throughput projections, TEU throughput would be the same as the proposed Project, with an expected throughput of approximately 3.2 million TEUs by 2027. This would translate into 390 annual ship calls at Berths 302-306. In addition, Alternative 6 would result in up to 10,830 peak daily truck trips (2,862,760 annual), and up to 2,953 annual rail trip movements. Configuration of all other landside terminal components would be identical to the existing terminal.
Impact NOI-1: Construction activities lasting more than 10 days in a 3-month period would exceed existing ambient exterior noise levels by 5 dBA or more at a noise-sensitive use.

Construction noise generated by this alternative would be similar to that generated by the proposed Project, and thus, the noise levels for general construction and pile driving as shown in Table 3.11-6 is applicable to this alternative.

CEQA Impact determination

General construction noise under this alternative, including construction of infrastructure for automation should that occur, would not increase the existing ambient noise levels at any identified noise receptor in the Project area by 5 dBA or more, but noise produced by pile driving during wharf construction would increase average ambient noise levels at Reservation Point by 5 dBA over existing levels. These impacts would be temporary in nature, but significant under CEQA.

Mitigation Measures

Mitigation measures MM NOI-1 and MM NOI-2 would be implemented.

Residual Impacts

Impacts would be less than significant.

NEPA Impact Determination

General construction noise under this alternative, including construction of infrastructure for automation should that occur, would not increase the existing ambient noise levels at any identified noise receptor in the Project area by 5 dBA or more, but noise produced by pile driving during wharf construction would increase average ambient noise levels at Reservation Point by 5 dBA over existing levels. These impacts would be temporary in nature, but significant under NEPA.

Mitigation Measures

Mitigation measures MM NOI-1 and MM NOI-2 would be implemented.

Residual Impacts

Impacts would be less than significant.

Impact NOI-2: Noise levels from construction activities would not exceed the ambient noise level by 5 dBA at a noise-sensitive use between the hours of 9:00 p.m. and 7:00 a.m. Monday through Friday, before 8:00 a.m. or after 6:00 p.m. on Saturday, or at any time on Sunday.

Construction activities for this alternative would not be conducted during nighttime hours.
CEQA Impact Determination

With the exception of dredging along Berth 306, construction activities for this alternative would not be conducted during nighttime hours. Night construction during dredging of Berth 306 would result in average noise levels which exceed the ambient levels at the Fish Harbor liveaboards or Reservation Point; however, the increases would be less than 2 dBA, and thus would not exceed the significance criteria at these locations. As a result, construction noise impacts under Alternative 6 would be less than significant under CEQA.

Mitigation Measures
No mitigation is required.

Residual Impacts
Impacts would be less than significant.

NEPA Impact Determination

As discussed above, night construction during dredging of Berth 306 would result in average noise levels which exceed the ambient levels at the Fish Harbor liveaboards or Reservation Point; however, the increases would be less than 2 dBA, and thus would not exceed the significance criteria at these locations. As a result, construction noise impacts under Alternative 6 would be less than significant under NEPA.

Mitigation Measures
No mitigation is required.

Residual Impacts
Impacts would be less than significant.

Impact NOI-3: Operations would not generate noise levels that exceed existing ambient noise levels at sensitive receivers by 3 dBA in CNEL to or within the ‘normally unacceptable’ or ‘clearly unacceptable category,’ or otherwise by 5 dBA or greater.

CEQA Impact Determination

Operational noise impacts at noise sensitive uses in the Port area would be the same as those for the proposed Project. As a result, operational noise impacts under Alternative 6 would be less than significant under CEQA.

Mitigation Measures
No mitigation is required.

Residual Impacts
Impacts would be less than significant.
NEPA Impact Determination

Operational noise impacts at noise sensitive uses in the Port area would be the same as those for the proposed Project. As a result, operational noise impacts under Alternative 6 would be less than significant under NEPA.

Mitigation Measures

No mitigation is required.

Residual Impacts

Impacts would be less than significant.

3.11.4.4 Summary of Impact Determinations

Table 3.11-8 summarizes the CEQA and NEPA impact determinations of the proposed Project and its alternatives related to Noise, as described in the detailed discussion above. This table is meant to allow easy comparison among the potential impacts of the proposed Project and its alternatives with respect to this resource. Identified potential impacts may be based on federal, state, and City of Los Angeles significance criteria, Port criteria, and the scientific judgment of the report preparers.

For each impact threshold, the table describes the impact, notes the CEQA and NEPA impact determinations, describes any applicable mitigation measures, and notes the residual impacts (i.e., the impact remaining after mitigation). All impacts, whether significant or not, are included in this table.

</tr>
<tr>
<td><strong>Responsible Parties</strong></td>
</tr>
<tr>
<td><strong>Residual Impacts</strong></td>
</tr>
</tbody>
</table>

| Mitigation Measure | **MM NOI-2: Erect Temporary Noise Attenuation Barriers Adjacent to Pile Driving Equipment, Where Necessary and Feasible.** Erect temporary noise attenuation barriers suitable for pile driving equipment as needed. The barriers should be installed directly between the equipment and the nearest noise sensitive use to the construction site. The need for and feasibility of noise attenuation barriers should be evaluated on a case-by-case basis considering the distance to noise sensitive receptors, the available space at the construction location, and taking account of safety and operational considerations. |
| **Timing** | During the bid process (i.e., as part of contract/construction specifications) and construction of the proposed Project. |
| **Methodology** | The contractor should install noise attenuation barriers, where feasible according to the above criteria in consultation with the LAHD and shall be monitored for compliance by the LAHD. |
| **Responsible Parties** | Construction contractor; LAHD |
| **Residual Impacts** | Less than significant |
3.11.5 Significant Unavoidable Impacts

Mitigation measures are expected to reduce residual construction noise impacts due to pile driving activities to a less than significant level. Construction noise would be short-term and would not exceed significance thresholds with mitigation, and after completion, there would be no long-term significant residual noise impact.
