FINAL FINDINGS OF FACT AND STATEMENT OF OVERRIDING CONSIDERATIONS

Southern California International Gateway (SCIG) Project

Environmental Impact Report (EIR)
(ADP NO. 041027-199 / SCH NO. 2005091116)

Prepared By:
Los Angeles Harbor Department
Environmental Management Division

San Pedro, CA 90731
Phone: (310) 732-3675

With Assistance From:

ENVIROCN
773 San Marin Drive, Suite 2115
Novato, CA 94998

March 2013
1.0 Introduction

These Findings of Fact have been prepared by the Los Angeles Harbor Department (LAHD, or Port) as the Lead Agency pursuant to § 21081 of the Public Resources Code (PRC) and § 15091 of the State California Environmental Quality Act (CEQA) Guidelines to support a decision on the Southern California International Gateway (SCIG) Project (proposed Project). Section 21081 of the Public Resources Code and § 15091 of the CEQA Guidelines provide that no public agency shall approve or carry out a project for which an Environmental Impact Report (EIR) has been certified that identifies one or more significant environmental effects of the project unless the public agency makes one or more written findings for each of those significant effects, accompanied by a brief explanation of the rationale for each finding. The possible findings are:

1. Changes or alterations have been required in, or incorporated into, the project, which avoid or substantially lessen the significant environmental effects as identified in the Final EIR.
2. Such changes or alterations are within the responsibility and jurisdiction of another public agency and not the agency making the finding. Such changes have been adopted by such other agency or can and should be adopted by such other agency.
3. Specific economic, legal, social, technological, or other considerations, including provisions of employment opportunities for highly trained workers, make infeasible the mitigation measures or project alternatives identified in the Final EIR.

Additionally, the Lead Agency shall not approve a project that will have a significant effect on the environment unless it finds that specific overriding economic, legal, social, technological, or other benefits of the project outweigh the unavoidable adverse environmental effects (PRC § 21081(b); 14 California Code of Regulations [CCR] § 15093). The LAHD has prepared the Statement of Overriding Considerations to document and substantiate the reasons to support its action based on the Final EIR and other information contained in the record. In accordance with the provisions of CEQA, the Board of Harbor Commissioners (Board) adopts the Findings and Statement of Overriding Considerations as set forth below, as part of the certification of the Final EIR.
2.0 Project Overview

2.1 Introduction

This section describes the proposed Project analyzed in the Southern California International Gateway Project (SCIG) EIR. The proposed Project is located approximately four miles to the north of the Ports, primarily on LAHD land in the City of Los Angeles but also on adjacent private property in the cities of Los Angeles, Carson, and Long Beach. The proposed Project involves constructing and operating an intermodal railyard that would transfer containerized cargo between trucks and railcars. The proposed Project is consistent with LAHD Resolution 6339 regarding intermodal rail facilities and the San Pedro Bay Ports Rail Update Study and has been proposed to meet an identified need for additional rail facilities in the port area.

2.2 Project Purpose

LAHD has expressed its intent to promote increased use of rail in general, and near-dock rail facilities in particular, as indicated in its Rail Policy (Section 2.1.1 of the Recirculated Draft EIR (RDEIR)), and to comply with the Mayor of Los Angeles’ goal for the LAHD to increase growth while mitigating the impacts of that growth on the local communities and the Los Angeles region by implementing pollution control measures, including the elements of the Clean Air Action Plan (CAAP) specific to the proposed Project. Similarly, the California Environmental Protection Agency (including California Air Resources Board and California Business and Transportation Agency (including Caltrans) have recommended the SCIG project as a preliminary candidate in the 2007 Goods Movement Action Plan. In addition, the Southern California Association of Governments (SCAG) has identified the SCIG project as potentially playing a key role in addressing the growth of high-density truck traffic in its 2008 Regional Transportation Plan Goods Movement Report (SCAG, 2008) and the 2012 Regional Transportation Plan (SCAG, 2012).

The proposed Project would help to meet the demand for efficient rail transport as contemplated by the LAHD’s Intermodal Rail Policy, adopted in Resolution 6297 on August 11, 2004 (LAHD, 2004), which calls for on-dock and near-dock intermodal facilities for shippers, carriers, terminal operators, and Class I Railroads. In addition, in a Resolution adopted February 9, 2005 (LAHD, Resolution 6339 (LAHD, 2005)), the LAHD found that there would be a strategic benefit to having competitively balanced, near-dock intermodal container transfer facilities, ensuring access for both of the Class I Railroads that serve the Ports. Furthermore, as discussed in Section 1.1 of the RDEIR, the need for more efficient, and hence more economical and less polluting, rail-based cargo transportation has prompted state and regional planning agencies to encourage the development of additional near-dock rail facilities (e.g. CARB, 2007; SCAG, 2012). Through a public process involving solicitation of expressions of interest, the Port selected the Burlington Northern Santa Fe (BNSF) Railway to propose a near-dock rail intermodal facility.

The primary objective and fundamental purpose of the proposed Project is to provide an additional near-dock intermodal rail facility serving the San Pedro Bay ports marine terminals that would meet current and anticipated containerized cargo demands, provide shippers with comparable intermodal options, incorporate advanced environmental
controls, and help convert existing and future truck transport into rail transport, thereby providing air quality and transportation benefits.

The following specific objectives of the proposed Project would accomplish the primary objective and fundamental purpose:

1. Provide an additional near-dock intermodal rail facility that would:
   a) Help meet the demands of current and anticipated containerized cargo from the various San Pedro Bay port marine terminals, and
   b) Combine common destination cargo “blocks” and/or unit trains collected from different San Pedro Bay Port marine terminals to build trains for specific destinations throughout the country.

2. Reduce truck miles traveled associated with moving containerized cargo by providing a near-dock intermodal facility that would:
   a) Increase use of the Alameda Corridor for the efficient and environmentally sound transportation of cargo between the San Pedro Bay Ports and destinations both inland and out of the region, and
   b) Maximize the direct transfer of cargo from port to rail with minimal surface transportation, congestion and delay.

3. Provide shippers carriers, and terminal operators with comparable options for Class 1 railroad near-dock intermodal rail facilities.

4. Construct a near-dock intermodal rail facility that is sized and configured to provide maximum intermodal capacity for the transfer of marine containers between truck and rail in the most efficient manner.

3.0 Project Description

The proposed Project involves constructing and operating an intermodal railyard that would transfer containerized cargo between trucks and railcars. The proposed Project area is currently occupied by port-related businesses under some existing and expired leases to holdover tenants. The proposed Project would therefore result in the termination or non-renewal of these leases and in some tenants moving to nearby alternate sites. Other non-LAHD land would require property acquisition by BNSF. For the purposes of this EIR, it is assumed that construction of the proposed Project would occur from 2013 to 2015 and that BNSF would operate SCIG under a new, 50-year lease with LAHD starting in 2016 and ending in 2066.

Major elements of the proposed Project evaluated in this EIR include:

- Property acquisition, relocation and/or tenancy termination of existing businesses, and the offering of new alternate sites by LAHD to some of the existing site occupants;
- Demolition of existing structures and construction of some tenant/business facilities on nearby alternate sites offered by the LAHD;
- Construction of lead rail tracks, including widening the Dominguez Channel rail bridge to connect the railyard to the Alameda Corridor and reconstructing the Sepulveda Boulevard rail bridge and the PCH overpass to accommodate Project operations;
• Construction and operation of an intermodal railyard consisting of loading and storage tracks for trains, electric-powered rail-mounted cranes incorporating regenerative braking technology, container loading and storage areas, a locomotive service area, administrative and yard equipment maintenance facilities, lighting, paved roadways, and a truck gate complex; and

• The use of CAAP-compliant drayage trucks on designated truck routes between SCIG and the Ports that would be monitored by GPS through requirements established in contracts for dray services.

3.1 Property Acquisition and Disposition of Businesses

The proposed Project requires acquisition or lease of non-LAHD properties by the project proponent BNSF and a new lease for the LAHD properties that would result in certain terminations or non-renewal of existing leaseholds and the movement or displacement of businesses occupying those properties. Of the existing businesses within the proposed Project site, only three (portions of California Cartage and Fast Lane Transportation (Fast Lane), and the Alameda Corridor Transportation Authority (ACTA) maintenance yard) are assumed, in order to ensure a conservative analysis, to move to alternate sites on nearby properties, although it is possible that California Cartage and Fast Lane would elect to make other arrangements. All other remaining businesses within the proposed Project site on LAHD properties would have their leases non-renewed/terminated and those on non-LAHD properties would be removed upon acquisition of the properties by BNSF. The displaced businesses for which no relocation sites were identified as part of the proposed Project or during the time of this analysis are assumed to move to other compatible areas in the general port vicinity as part of their own business operations and plans.

The identified alternate locations for a portion of Fast Lane Transportation and a portion of California Cartage operations are located south of the railyard site, and the ACTA maintenance facility would move to an approximately 2.5-acre site west of the Dominguez Channel. The proposed Project assumes that California Cartage would maintain the property they currently lease from SCE, and that Fast Lane would continue to operate on parcels it currently occupies outside the Project site. These businesses would construct new facilities on the alternate sites that are assumed to generally resemble the existing facilities except for being more modern and efficient. They are assumed to continue operating on their existing parcels through the first construction year while the new facilities are being constructed and then to resume operations on their new sites and their existing property.

3.2 Railyard Elements

The new railyard (described in detail in Section 2.4.2.2 of the RDEIR) would have three major sets of tracks (two sets of loading tracks, each with six tracks, and one set of two storage tracks) comprising a total of approximately 105,000 feet of track (including the north and south lead tracks, see below) and at least 37 switches. The railyard would also include a number of support elements such as cargo-handling equipment (yard hostlers and support vehicles), 20 electric-powered, rail-mounted, wide-span gantry cranes (RMGs) up to 98 feet high for loading and unloading trucks and trains and managing the
stacks of containers, office and maintenance buildings, 40 high-mast light standards for area lighting, and a truck gate complex.

Two sets of lead tracks (described in detail in sections 2.4.2.3 and 2.4.2.4 of the RDEIR) would extend north and south from the railyard. The two north lead tracks, one from each group of loading tracks, would be elevated and would cross first the SCE property and an existing access road via an overpass and then Sepulveda Boulevard on a rail bridge to connect the railyard to the ports’ San Pedro Branch track. These approximately 1,000-foot-long tracks would operate primarily as tail tracks for the assembly and breaking down of trains. The north lead tracks would require the relocation of existing SCE electrical towers in order to meet clearance requirements by the State Public Utilities Commission (PUC). The two south lead tracks, each approximately 4,000 feet long, would link the railyard to the Alameda Corridor, west of the facility, and would serve as the facility’s connection to the regional rail network; normally, all trains would enter and exit the facility on the south lead tracks. The south lead tracks would curve westward under PCH, connect to the ports’ Long Beach Lead track, cross the Dominguez Channel on a reconstructed bridge, and then join the Alameda Corridor mainline tracks. Two short tracks near the south lead tracks would be used for locomotive fueling and minor servicing; no locomotive maintenance would occur at the proposed Project.

The proposed Project would include a number of roadway and trackage improvements (described in detail in Section 2.4.2.5 of the RDEIR) in order to provide truck and train access to the SCIG facility and adjacent SCE property. A new interchange would be constructed on the Pacific Coast Highway (PCH) to provide truck access to the facility and to allow the south lead tracks to pass under the PCH. The Dominguez Channel Bridge would be widened to accommodate the south lead tracks, and the existing railroad bridge over Sepulveda Boulevard would be replaced by a modern bridge capable of carrying three tracks (the north lead tracks and the San Pedro Branch track). An access road with an underpass at Sepulveda Boulevard would be constructed beneath the elevated north lead tracks to provide truck and other vehicular access to the SCE property.

### 3.3 Construction

As analyzed in the EIR, construction of the proposed project would occur over an approximate 36-month period from 2013 to 2015, with the last phase limited to the erection of cranes in 2015. In addition to construction of the proposed Project, construction activities would occur at the alternate business locations. Construction activities (described in detail in Section 2.4.3 of the RDEIR) would occur essentially simultaneously in three major areas:

1. The railyard including the north lead tracks and railroad bridge over Sepulveda Blvd;
2. PCH grade separation and interchange;
3. The south lead tracks area along the Long Beach Lead and Alameda Corridor, including the Dominguez Channel Bridge.

Depending on the amount of construction activity at any given time, there would be 30 to 150 workers per day, 12 to 30 pieces of construction equipment, and 30 to 150 vehicles transporting workers and materials to and from the various construction areas. Construction would normally occur during one 10-hour shift per day, up to six days per week, consistent with City of Los Angeles code requirements to reduce noise and limit...
construction activities to daytime hours (and, for the portion of construction within the City of Long Beach, consistent with the City of Long Beach code requirements).

Activities common to all construction activities would include servicing construction equipment at designated areas; transporting construction workers, supervisors, and inspectors onsite in light-duty trucks and light buses; and controlling dust, track-out, and erosion by following a Construction Storm Water Pollution Prevention Plan. Construction in all areas would also include soil and groundwater remediation as necessary, hazardous waste management from demolition and remediation activities, staging area management, and public utility and traffic management.

3.4 Operations

The SCIG facility is assumed to begin operation at the start of 2016 and reach full operation (maximum capacity) in 2035. It would operate 24 hours a day (three labor shifts), 7 days per week, 360 days per year; trucks and trains would arrive at and depart from the facility day and night. Upon opening, the facility would have approximately 93 employees, which would increase to a maximum of 450 employees at full operation, with local resident’s priority hiring. The facility’s design and operational model include a high degree of automation and computerized logistics management in order to minimize truck trips.

Containers would be picked up from and delivered to the marine terminals in the Ports by on-road drayage trucks (big-rig, semi-trailer trucks) operated under contracts between various trucking companies and BNSF for drayage between the SCIG railyard and the Ports. The contracts would specify that all trucks would be powered by engines that meet or exceed the 2007 EPA on-road standards, thereby ensuring compliance with the 2010 CAAPs Clean Truck Program engine emissions requirements. This document assumes that only marine cargo, i.e., direct intermodal cargo, would be handled at the facility.

The facility would operate like a circuit. Drayage trucks would arrive at and depart from the facility hauling shipping containers on chassis. At full capacity, an average of approximately 5,542 trucks, carrying 4,167 containers, would arrive at and depart from the facility each day, as well as employee and vendor traffic. Drayage would occur along designated truck routes to avoid residential areas, which would be enforced through BNSF’s drayage contracts by requiring global positioning system (GPS) units. Inbound trucks would enter the SCIG railyard from the PCH off-ramps and proceed to an on-site entry portal to undergo an automated inspection and identification process before entering onsite queuing lanes leading to checkpoints and the facility entrance. Trucks would be directed to trackside where the container would be unloaded either directly to a railcar or onto a container stack by the RMG cranes. Most empty trucks would then be directed to another area to be loaded with an outbound container by another RMG, although in some cases a truck might leave the facility empty.

At full operation, the SCIG railyard is expected to handle eight inbound and eight outbound trains per day. The trains would enter and leave the facility via the Alameda Corridor. Consistent with CAAP Measure RL-2 and pursuant to the 2005 California Air Resources Board (CARB) Memorandum of Understanding, BNSF would maximize the use of ultra-low sulfur diesel (ULSD) fuel in the locomotives that would haul the trains. Inbound trains would exit the Alameda Corridor, proceed across the Dominguez Channel Bridge onto one of the facility’s south lead tracks, and be routed onto a clear unloading (strip) track. Trains would typically be longer than a single strip track, and would have to
be divided into two smaller segments (blocks) in order to be positioned on the strip tracks for loading and unloading. Outbound trains would be assembled (“built”) and leave the facility in essentially the reverse process. Locomotive movements within the railyard and along the north lead track would not require the locomotives to sound their horns, as warning devices such as lights and barriers to prevent rail/truck conflicts would eliminate the need for horns.

The proposed Project would provide BNSF with the capacity to handle an estimated 1.5 million containers or 2.8 million TEUs (Twenty-foot-Equivalent Units, a measure of containerized cargo based on a standard twenty-foot-long container; because containers come in several sizes, the conversion factor between number of containers and TEUs is roughly 1.85) per year at full operation and would involve approximately 2 million truck trips between the facility and port terminals per year. The truck trips would replace truck trips that would otherwise go to the BNSF Hobart/Commerce Yard in East Los Angeles, a journey of 24 miles each way. The proposed facility would incorporate an operational model that emphasizes the efficient movement of trucks and trains by incorporating design elements to enhance fluidity of operations and providing direct rail access to the Alameda Corridor, thereby increasing the benefits expected from the Alameda Corridor’s use.

4 CEQA Findings

The Findings of Fact are based on information contained in the Draft EIR (DEIR) for chapters that were not recirculated, the Recirculated Draft EIR (RDEIR), and the Final EIR (FEIR) for the proposed Project, as well as information contained within the administrative record. The administrative record includes, but is not limited to, the proposed Project application, Project staff reports, Project public hearing records, public notices, written comments on the Project and responses to those comments, proposed decisions and findings on the proposed Project, and other documents relating to the agency decision on the Project.

The DEIR and RDEIR address the Project’s potential effects on the environment, and were circulated for public review and comment pursuant to the State CEQA Guidelines for a period of 90 days (plus an extension) and 45 days, respectively.

Consistent with CEQA Guidelines Section 15088.5(c), the LAHD recirculated portions of the Draft EIR that were revised and replaced. The revised chapters (including sections) and appendices include:

- Executive Summary
- Chapter 1 Introduction
- Chapter 2 Project Description
- Chapter 3 Environmental Analysis
- Section 3.1 Aesthetics/Visual Resources
- Section 3.2 Air Quality and Meteorology
- Section 3.6 Greenhouse Gas Emissions and Climate Change
- Section 3.7 Hazards and Hazardous Materials
- Section 3.8 Land Use
- Section 3.9 Noise
- Section 3.10 Transportation/Circulation
The LAHD determined that the following chapters and sections did not require recirculation because the new information added or changes made to those portions of the Draft EIR did not trigger any of the requirements for recirculation under CEQA Guidelines § 15088.5(a).

- Section 3.3 Biological Resources
- Section 3.4 Cultural Resources
- Section 3.5 Geology and Soils
- Section 3.11 Public Services and Utilities
- Section 3.12 Water Resources
- Chapter 8 Growth-Inducing Impacts
- Chapter 9 Significant Irreversible Changes
- Chapter 11 List of Preparers and Contributors
- Appendix A Notice of Intent/Notice of Preparation/Initial Study
- Appendix B Aesthetics Visual Resource Methodology
- Appendix D SCIG Cultural and Paleontological Reports
- Appendix E SCIG Environmental Site Assessments
- Appendix F2 Combined Analysis of SCIG and ICTF Facilities – Supporting Noise Data
- Appendix G3 Traffic Grade Crossing Delay Methodology

Comments were received from a variety of public agencies, organizations, and individuals. The FEIR contains copies of all comments and recommendations received on the DEIR and RDEIR; a list of persons, organizations and public agencies commenting on the DEIR and RDEIR; responses to comments received during the public review on the DEIR for chapters that were not recirculated and on the RDEIR; and identifies changes to the DEIR and RDEIR. This section provides a summary of the significant environmental impacts of the proposed Project that are discussed in the non-recirculated chapters of the DEIR, the RDEIR, and the FEIR, and provides written findings for each of the significant impacts, which are accompanied by a brief explanation of the rationale for each finding.
4.1 Environmental Impacts of the Proposed Project

Findings are provided for significant and unavoidable environmental impacts and significant impacts that are mitigated to less than significant. Where mitigation measures are proposed, these mitigation measures are included in a Mitigation Monitoring Reporting Plan (MMRP), which has been prepared separately from these findings.

In addition to the mitigation measures that have been required in, or incorporated into, the proposed Project, several alternatives were identified in the EIR in order to attempt to reduce significant environmental impacts associated with the proposed Project. All alternatives to the proposed Project and associated findings are discussed in this document.

4.1.1 Environmental Impacts Found to Be Significant and Unavoidable

The LAHD Board of Commissioners hereby finds that the following environmental impacts (in Table 1) of the proposed Project are significant and unavoidable:

### 4.1.2 Environmental Impacts Found to Be Less Than Significant after Mitigation

The LAHD Board of Commissioners hereby finds that the following environmental impacts (in Table 2) of the proposed Project are less-than-significant after implementation of mitigation measures.

#### Table 2. Significant Impacts that can be Mitigated for the Proposed Project.

</table>
4.1.3 Environmental Impacts Found to Be Less Than Significant

The LAHD Board of Commissioners hereby finds that the following environmental impacts (Table 3) of the proposed Project are less than significant and hereby makes the same determination based on the conclusions in the FEIR. Under CEQA, no mitigation measures are required for impacts that are less than significant (14 Cal. Code Regs. § 15126.4(a)(3)).

Table 3. Less than Significant Impacts of the Proposed Project.

</tr>
</tbody>
</table>

**Greenhouse Gas Emissions and Climate Change**

| GHG-2: The proposed Project would not conflict with State and local plans and policies adopted for the purpose of reducing GHG emissions. | Less than significant impact | Not applicable. |

**Hazards and Hazardous Materials**

| RISK-1: The proposed Project would not substantially increase the probable frequency and severity of consequences to people or property as a result of a potential accidental release or explosion of a hazardous substance. | Less than significant impact | Mitigation not required. |
| RISK-2a: Construction activities would increase the probable frequency and severity of consequences to people from exposure to health hazards. | Less than significant impact | Mitigation not required. |
| RISK-2b: Operations at the Proposed Project would not increase the probable frequency and severity of consequences to people from exposure to health hazards. | Less than significant impact | Mitigation not required. |
| RISK-3: The proposed Project would not create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials. | Less than significant impact | Mitigation not required. |
| RISK-4: Construction and operations at the proposed Project would not create a significant hazard to the public or the environment as a result of the proposed Project being located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code § 65962.5. | Less than significant impact | Mitigation not required. |

</table>
4.2 Findings Regarding Environmental Impacts Found to Be Significant and Unavoidable

The following Findings pertain to the significant environmental impacts of the Project for which feasible mitigation measures are not available to avoid or substantially lessen the significant environmental effects to below a level of significance. The impacts would remain significant and unavoidable.

4.2.1 Aesthetics/Visual Resources

As discussed in Section 3.1 of the RDEIR, there would be one unavoidable significant impact to aesthetics/visual resources as a result of the proposed Project. The impact and mitigation measures are discussed below.

Impact AES-1: The proposed Project would cause a substantial degradation of the existing visual character or quality of the site and its surroundings.

The Project area would be cleared of existing structures and miscellaneous site features such as pavement, curbs, signs and above-ground utilities prior to construction. New 98-foot-tall cranes would be introduced, a new administration and a new crane servicing building would be built in the northeast corner of the Project site. The railroad line that traverses the east side of the Project site would be altered and would be situated on a portion of the Southern California Edison right-of-way. The proposed Project would be expected to have similar heavy industrial and/or rail activities and would not be expected to contrast with the existing visual character or quality of the site or its surroundings. The new PCH intersection and the reconstructed Dominguez Channel railroad bridge would closely resemble the existing structures. The new bridge would be modern in design and consistent with current railroad bridge construction practices. However, it would replace the historic elements of the existing bridge and would result in a different view. Although the quality of the existing views is considered to be moderately low, the proposed Project would create a distinct contrast with the established setting character and quality.

On the alternate business sites, the few existing structures would be demolished as necessary and new structures and paving would be installed. The existing structures were not identified as having valuable visual characteristics in the overall industrial context of the Project site. New development on the alternate sites would consist of low structures, low-intensity lighting, and fencing and paving. These developments would be consistent with the existing visual character of those sites.

With one exception, the proposed Project would cause no unfavorable and additional contrast with features associated with the aesthetic image of the areas seen from key public viewing positions. Although elements of the existing Project site would be removed and replaced with new elements, most of the changes would not alter the visual character of the area, which is industrial and generally considered to be of low visual quality. The construction of the sound wall as noise mitigation (MM NOI-1) would create a change in the visual environment. However, the current visual environment, even from the perspective of the residences, school, and park viewing from the east (Key Views 2 and 3 described in the RDEIR), does not include a unique or valued visual character. Current views from these land uses towards the Project site consist primarily of the very high intensity Port development located west of the Dominguez Channel and the
SCE transmission towers on the east side of the Project site. These structures are over 100 feet in height and dominate the west-facing views from these land uses. The buffer wall would be constructed in compliance with applicable regulations and would not substantially degrade the visual character compared to existing conditions. With one exception, therefore (the Sepulveda Boulevard railroad bridge, see below), the proposed Project, including alternate business sites, would have less than significant impacts on the visual characteristics of the proposed Project area.

In the case of the Sepulveda Boulevard railroad bridge, the existing visual character of the area is industrial in nature, and the new bridge, which would be built as a modern railroad bridge consistent with current railroad bridge construction practices, would be consistent with the industrial visual characteristics of the area. Nevertheless, the existing bridge is a historically significant structure (see Section 3.4, Cultural Resources of the RDEIR), and its demolition and the construction of the new bridge would result in a substantial change in the visual environment as seen from Key View 4 (described in Section 3.1.4.3 of the RDEIR). This change is considered a significant impact.

**Finding**

The Board hereby finds that changes or alterations have been required in, or incorporated into the project that avoid or substantially lessen the significant environmental effect identified in the FEIR. Implementation of mitigation measures MM CR-2 and MM CR-3 would reduce adverse visual effects to the historical resource, but the impact would remain significant and unavoidable. Specific economic, legal, social, technological, or other considerations make infeasible any additional mitigation measures.

**Rationale for Finding**

Mitigation is required for the significant impact associated with the demolition of the Sepulveda Boulevard railroad bridge. Implementation of mitigation measures MM CR-2 and MM CR-3 would ensure that historic elements of the existing railroad bridge would be maintained to the greatest extent feasible, which would reduce the degree to which the view of the bridge would be altered. However, it is not certain how much, if any, of the historic elements of the bridge could be retained, due to the need to demolish and replace the bridge, as the existing bridge cannot accommodate three tracks. Therefore, visual impacts would remain significant and unavoidable. No further mitigation is available to reduce this impact to less than significant.

### 4.2.2 Air Quality and Meteorology

As discussed in Section 3.2 of the RDEIR, there would be three unavoidable significant impacts to Air Quality and Meteorology related to construction and operation as a result of the proposed Project. The impacts and mitigation measures are discussed below.

**Impact AQ-1:** The proposed Project would result in construction-related emissions that exceed an SCAQMD threshold of significance.

The unmitigated peak daily construction emissions would exceed the South Coast Air Quality Management District (SCAQMD) daily emission thresholds for VOC, CO, NOx, PM$_{10}$, and PM$_{2.5}$ during the construction period of 2013-2015. Therefore, proposed
Project construction emissions would be significant under CEQA for VOC, CO, NOx, PM_{10}, and PM_{2.5} prior to mitigation.

**Finding**

The Board hereby finds that changes or alterations have been required in, or incorporated into the project that avoid or substantially lessen the significant environmental effect identified in the FEIR. Incorporation of mitigation measures MM AQ-1 through MM AQ-6 would reduce construction emissions; however, emissions of VOC, CO, NOx, PM_{10}, and PM_{2.5} during construction would remain significant. Specific economic, legal, social, technological, or other considerations make infeasible any additional mitigation measures.

**MM AQ-1: Fleet Modernization for Construction Equipment.**

- Tier Specifications:
  - a. From January 1, 2012 to December 31, 2014: All off-road diesel-powered construction equipment greater than 50 hp, except marine vessels and harbor craft, will meet Tier-3 off-road emission standards at a minimum. In addition, all construction equipment greater than 50 hp will be retrofitted with a CARB-verified Level 3 DECS. Any emissions control device used by the contractor shall achieve emissions reductions that are no less than what could be achieved by a Level 3 diesel emissions control strategy for a similarly sized engine as defined by CARB regulations.
  - b. From January 1, 2015 on: All off-road diesel-powered construction equipment greater than 50 hp, except marine vessels and harbor craft, will meet Tier-4 off-road emission standards at a minimum. Any emissions control device used by the contractor shall achieve emissions reductions that are no less than what could be achieved by a Level 3 diesel emissions control strategy for a similarly sized engine as defined by CARB regulations.

As per the Sustainable Construction Guidelines for CEQA project mitigation, construction equipment were modeled according to the following fleet mix:

- a. In 2012 to 2014: 50% Tier 3 Level 3, 20% Tier 2 Level 3, 10% Tier 1 Level 3, 10% Tier 2 Level 2, and 10% Tier 1 Level 2.
- b. In 2015: 50% Tier 4, Tier 3 Level 3, 20% Tier 3 Level 3, 10% Tier 1 Level 3, 10% Tier 2 Level 2, and 10% Tier 1 Level 2.

A copy of each unit’s certified tier specification, BACT documentation, and CARB or SCAQMD operating permit shall be provided at the time of mobilization of each applicable unit of equipment. The above “Tier Specifications” measures shall be met, unless one of the following circumstances exists, and the contractor is able to show that any of these circumstances exists:

- A piece of specialized equipment as specified in (a) and (b) above is unavailable within 200 miles of the Port of Los Angeles, including through a leasing agreement. If this circumstance exists, the equipment must comply with one of the options contained in the Step Down Schedule as shown in Table A of the guidelines document. (LAHD, 2009) At no time shall equipment meet less than a Tier 1 engine standard with a CARB-verified Level 2 DECS.
• The availability of construction equipment shall be reassessed on an annual basis. For example, if a piece of equipment is not available in 2013, the contractor shall reassess this availability on January 1, 2014.
• Construction equipment shall incorporate, where feasible emissions-savings technology such as hybrid drives and specific fuel economy standards. This mitigation measure was not quantified in the mitigated construction emissions.
• Idling shall be restricted to a maximum of 5 minutes when not in use. This mitigation measure was not quantified in the mitigated construction emissions.

**MM AQ-2: Fleet Modernization for On-Road Trucks.**

• Trucks used in construction will be required to comply with EPA Standards as described below.
  a. For On-road trucks with a gross vehicle weight rating (GVWR) of at least 19,500 pounds: Comply with USEPA 2010 on-road emission standards for PM10 and NOx (0.01 grams per brake horsepower-hour (g/bhp-hr) and 0.2 g/bhp-hr or better, respectively).
  b. A copy of each unit’s certified EPA rating and each unit’s CARB or SCAQMD operating permit, will be provided at the time of mobilization of each applicable unit of equipment.
  c. Trucks hauling material such as debris or any fill material will be fully covered while operating off Port property. This mitigation measure was not quantified in the mitigated construction emissions.
  d. Idling will be restricted to a maximum of 5 minutes when not in use. This mitigation measure was not quantified in the mitigated construction emissions.

**MM AQ-3: Additional Fugitive Dust Controls.**

The calculation of fugitive dust (PM) from Project earth-moving activities assumes a 69 percent reduction from uncontrolled levels to simulate rigorous watering of the site and use of other measures (listed below) to ensure Project compliance with SCAQMD Rule 403.

The Project construction contractor shall submit a fugitive dust control plan or notification to SCAQMD (for construction sites greater than 50 acres) prior to construction and comply with the requirements of Rule 403 throughout construction.

The following measures to further reduce fugitive dust emissions to a total reduction of 90 percent from uncontrolled levels should be implemented and/or included in the contractor’s fugitive dust control plan:

• SCAQMD’s Best Available Control Technology (BACT) measures must be followed on all projects. They are outlined on Table 1 in Rule 403. Large construction projects (on a property which contains 50 or more disturbed acres) shall also follow Rule 403 Tables 2 and 3.
• Active grading sites shall be watered three times per day, as also addressed in SCAQMD Rule 403.
• Contractors shall apply approved non-toxic chemical soil stabilizers to all inactive construction areas or replace groundcover in disturbed areas.
• Contractors shall provide temporary wind fencing around sites being graded or cleared.
- Trucks hauling dirt, sand, or gravel shall be covered or shall maintain at least 2 feet of freeboard in accordance with § 23114 of the California Vehicle Code. (“Spilling Loads on Highways”).
- Construction contractors shall install wheel washers where vehicles enter and exit unpaved roads onto paved roads, or wash off tires of vehicles and any equipment leaving the construction site.
- The grading contractor shall suspend all soil disturbance activities when winds exceed 25 mph or when visible dust plumes emanate from a site; disturbed areas shall be stabilized if construction is delayed.
- Open storage piles (greater than 3 feet tall and a total surface area of 150 square feet) shall be covered with a plastic tarp or chemical dust suppressant.
- Stabilize the materials while loading, unloading and transporting to reduce fugitive dust emissions.
- Belly-dump truck seals should be checked regularly to remove trapped rocks to prevent possible spillage.
- Comply with track-out regulations and provide water while loading and unloading to reduce visible dust plumes.
- Waste materials should be hauled off-site immediately.
- Pave road and road shoulders where available.
- Traffic speeds on all unpaved roads shall be reduced to 15 mph or less.
- Provide temporary traffic controls such as a flag person, during all phases of construction to maintain smooth traffic flow.
- Schedule construction activities that affect traffic flow on the arterial system to off-peak hours to the extent practicable.
- Require the use of clean-fueled sweepers pursuant to SCAQMD Rule 1186 and Rule 1186.1 certified street sweepers. Sweep streets at the end of each day if visible soil is carried onto paved roads on-site or roads adjacent to the site to reduce fugitive dust emissions.
- Appoint a construction relations officer to act as a community liaison concerning on-site construction activity including resolution of issues related to PM10 generation.

**MM AQ-4: Best Management Practices.**

The following measures are required on construction equipment (including onroad trucks)\(^1\):

- Use diesel oxidation catalysts and catalyzed diesel particulate traps.
- Maintain equipment according to manufacturers’ specifications.
- Restrict idling of construction equipment to a maximum of 5 minutes when not in use.
- Install high-pressure fuel injectors on construction equipment vehicles.

LAHD shall implement a process by which to select additional BMPs to further reduce air emissions during construction. The LAHD shall determine the BMPs once the contractor identifies and secures a final equipment list.

---

\(^1\) Where not already covered under MM AQ-1.
Because the effectiveness of this measure has not been established and includes some emission reduction technology which may already be incorporated into equipment as part of the Tier level requirement in MM AQ-1, it is not quantified in this study.

**MM AQ-5: General Construction Mitigation Measure.**

For any of the above construction mitigation measures (MM AQ-1 through AQ-3), if a CARB-certified technology becomes available and is shown to be equal or more effective in terms of emissions performance than the existing measure, the technology may be used to replace the existing measure pending approval by the LAHD. Because the effectiveness of this measure cannot be established, it is not quantified in this study.

**MM AQ-6: Special Precautions near Sensitive Sites.**

When construction activities are planned within 1,000 feet of sensitive receptors (defined as schools, playgrounds, day care centers, and hospitals) identified in Table 3.2-6, the construction contractor shall notify each of these sites in writing at least 30 days before construction activities begin. Because the effectiveness of this measure has not been established, it is not quantified in this study.

**Rationale for Finding**

While the mitigation measures presented in the FEIR reduce emissions, emissions would still exceed SCAQMD significance criteria for VOC, CO, NOx, PM$_{10}$, and PM$_{2.5}$ during construction. Mitigation measures MM AQ-1 through MM AQ-6, however, represent feasible means to reduce air pollution impacts from proposed construction sources.

Emissions will largely come from diesel-powered construction equipment, on-road trucks, and cargo ships for crane delivery. As part of the RDEIR, mitigation was developed aiming at reducing these emissions through accelerating fleet turnover to newer, cleaner equipment, adding retrofit devices and employing best management practices (BMPs). Mitigation measure MM AQ-2 was modified in the FEIR based on public comments, and requires all trucks used in construction to meet model year 2010 on-road heavy-duty truck emission standards. No additional mitigation beyond that identified in the FEIR is feasible at this time, however, because of limitations on the availability of required technology in the existing construction fleet.

**Impact AQ-2: The proposed Project construction would result in offsite ambient air pollutant concentrations that exceed a SCAQMD threshold of significance.**

Dispersion modeling of onsite and offsite proposed Project construction emissions was performed to assess the impact of the unmitigated proposed Project construction on offsite ambient air concentrations. A complete dispersion modeling report is included in Appendix C2 of the RDEIR.

The maximum 1-hour NO$_2$ concentration and the annual NO$_2$ concentration would exceed the SCAQMD significance threshold. The 98th percentile 1-hour NO$_2$ concentration would also exceed the NAAQS, which is based on an 8th highest maximum value and is a standard not yet adopted as a threshold of significance by the SCAQMD. The maximum 1-hour and 8-hour CO concentrations and the maximum 1-hour and 24-hour SO$_2$ concentrations from construction of the proposed Project would be well below the SCAQMD significance thresholds. The 99th percentile 1-hour SO$_2$ concentration would also be below the NAAQS, a standard not yet adopted by SCAQMD.
as the SCAB is in attainment. The maximum 24-hour PM$_{10}$ concentration, annual PM$_{10}$ concentration, and the maximum 24-hour PM$_{2.5}$ concentration would exceed the SCAQMD significance threshold for construction.

Implementation of mitigation measures MM AQ-1 through MM AQ-3 would substantially lessen emissions from criteria pollutants associated with construction of the proposed Project and reduce the ambient impact relative to the unmitigated Project levels. Tables 3.2-21 and 3.2-22 of the RDEIR present the maximum off-site ground level concentrations of criteria pollutants estimated for the mitigated Project construction. These data show that the mitigation measures would reduce all pollutant impacts, but that 1-hour and annual NO$_2$ and 24-hour and annual PM$_{10}$ increments would still exceed the SCAQMD ambient thresholds. The 24-hour PM$_{2.5}$ increment would fall below the SCAQMD ambient threshold.

**Finding**

The Board hereby finds that changes or alterations have been required in, or incorporated into the project that avoid or substantially lessen the significant environmental effect identified in the FEIR. Implementation of mitigation measures MM AQ-1 through MM AQ-3 would reduce the ambient impact relative to unmitigated Project levels; however, construction equipment emission concentrations remain significant and unavoidable for 1-hour and annual NO$_2$ and 24-hour and annual PM$_{10}$ concentrations during construction. Specific economic, legal, social, technological, or other considerations make infeasible any additional mitigation measures.

**Rationale for Finding**

Changes or alterations have been incorporated into the project in the form of mitigation measures MM AQ-1 through MM AQ-3 which would reduce the ambient impact relative to unmitigated Project levels. Although reduced as a result of the mitigation measures, construction equipment emission concentrations remain significant and unavoidable during construction for 1-hour and annual NO$_2$ and 24-hour and annual PM$_{10}$ concentrations. Mitigation measures MM AQ-1 through MM AQ-3, however, represent feasible means to reduce air pollution impacts from proposed construction sources. Emissions will largely come from diesel-powered construction equipment, on-road trucks, and cargo ships for crane delivery. As part of the RDEIR, mitigation was developed aiming at reducing these emissions through accelerating fleet turnover to newer, cleaner equipment, adding retrofit devices and employing best management practices (BMPs). No additional mitigation beyond that identified in the FEIR is feasible at this time, however, because of limitations on the availability of required technology in the existing construction fleet.

**Impact AQ-4: The Project operations would result in offsite ambient air pollutant concentrations that would exceed a SCAQMD threshold of significance.**

Dispersion modeling of onsite and offsite Project operational emissions was performed to assess the impact of the Project on local offsite air concentrations. A summary of the dispersion modeling results is presented here, and the complete dispersion modeling report is included in Appendix C2 of the RDEIR.

The maximum 1-hour NO$_2$ concentration and the annual NO$_2$ concentration would exceed the SCAQMD significance threshold. The 98$^{th}$ percentile 1-hour NO$_2$
concentration would also exceed the national ambient air quality standard (NAAQS), a standard not yet adopted as a threshold of significance by SCAQMD. The maximum 1-hour and 8-hour CO concentrations and the maximum 1-hour and 24-hour SO\textsubscript{2} concentrations from operational emissions of the Project would be well below the SCAQMD significance thresholds. The 99\textsuperscript{th} percentile 1-hour SO\textsubscript{2} concentration would also be below the national ambient air quality standard (NAAQS), a standard not yet adopted as a threshold of significance by SCAQMD.

The maximum 24-hour PM\textsubscript{10} concentration, the annual PM\textsubscript{10} concentration, and the maximum 24-hour PM\textsubscript{2.5} concentration would exceed the SCAQMD significance threshold for operation. However, it should be noted that there are only three receptors that are over the SCAQMD threshold for PM2.5. The maximum is located on the railroad tracks, just south of the alternate site for Fast Lane. The other two are on the newly constructed tracks which run between the alternate sites for Fast Lane and Cal Cartage.

Mitigation measure MM AQ-7 has been developed to control fugitive dust PM\textsubscript{10} and PM\textsubscript{2.5} emissions at the SCIG facility only. Implementation of this measure would substantially lessen emissions associated with operation of the proposed Project.

Finding

The Board hereby finds that changes or alterations have been required in, or incorporated into, the project that avoid or substantially lessen the significant environmental effect identified in the FEIR. However, after mitigation, the maximum mitigated Project operations would still exceed the SCAQMD 1-hour and annual NO\textsubscript{2}, 24-hour and annual PM\textsubscript{10}, and 24-hour PM\textsubscript{2.5} ambient thresholds. Specific economic, legal, social, technological, or other considerations make infeasible any additional mitigation measures.

MM AQ-7: On-Site Sweeping at SCIG Facility.

BNSF shall sweep the SCIG facility on-site, along routes used by drayage trucks, yard hostlers, service trucks and employee commuter vehicles, on a weekly basis using a commercial street sweeper or any technology with equivalent fugitive dust control.

Rationale for Finding

Changes or alterations have been required in or incorporated into the project in the form of mitigation measure MM AQ-7 which substantially lessens fugitive dust emissions, as shown in Table 3.2-31 of the RDEIR. Although reduced as a result of the mitigation measures, ambient air concentrations emissions remain significant and unavoidable for 1-hour and annual NO\textsubscript{2} and annual PM\textsubscript{10}, and 24-hour PM\textsubscript{2.5}. Mitigation measure MM AQ-7 represents feasible means to reduce air pollution impacts from proposed operational sources.

Additional mitigation measures for SCIG were considered for addressing impacts related to AQ-4, operational off-site pollutant ambient concentrations. These measures were evaluated in terms of whether they were capable of being accomplished in a successful manner within a reasonable period of time, taking into account economic, environmental, legal, social, and technological factors. The measures below (some of which were identified in comment letters on the DEIR and RDEIR) were evaluated and determined to be infeasible for consideration as enforceable mitigations:
Among the considered mitigation measures, the Advanced Locomotive Emission Control System (ALECS) was designed by Advanced Cleanup Technologies, Inc. (ACTI) to consist of a bonnet, or hood, placed over a locomotive's exhaust stack to capture exhaust pollutants emitted by the locomotive. This system was designed to capture locomotive emissions while the locomotive is motionless or moving slowly within the range of physical extension of the hood system. The exhaust captured by the hood is then sent to an Emission Treatment Subsystem (ETS) which uses catalytic and scrubber aftertreatment technology to eliminate pollutants from the captured exhaust of the locomotives. Although the ALECS system went through proof-of-concept testing on a limited scale at the Union Pacific (UP) Roseville Railyard (Chan M., Jackson M. D., 2007) as part of a multi-agency stakeholder process, the system was never scaled up to full implementation at a railyard as a result of a number of technical issues. Idling emissions were not determined to be a significant portion of total railyard emissions in the testing, and therefore a number of hoods and substantial range of extension would be needed to capture a reasonable fraction of emissions from multiple trains calling on a railyard. Idling emissions at SCIG are reduced through the use of Automatic Engine Start Stop (AESS) devices equipped on all linehaul locomotives, and therefore control of emissions from locomotive movement in the facility would require extensive overhead infrastructure to move the bonnet throughout the rail tracks on-site. This setup is not feasible given the physical constraints of the facility and the operation of live lifts.

Switching Locomotives Conducting Build/Break Activities at SCIG – an alternate operation of the facility was considered as a mitigation measure, in which low-emission switcher locomotives would conduct all breakdown and build activities at the SCIG facility. This mitigation measure was determined to be infeasible as connection of the low-emissions switcher to the locomotives would require leaving SCIG locomotives stopped on the Alameda Corridor, thus posing a traffic hazard to trains using the corridor, and would also require additional rail trackage on the SCIG site to allow the switchers to connect to the locomotives which is not feasible due to physical constraints of the SCIG site.

Zero-Emissions Container Movement Systems for Locomotives – this mitigation measure was considered infeasible, and a technical discussion is provided in Section 5.2.2 of the RDEIR. Zero-emission container movement systems such as maglev and linear induction have not been feasibly demonstrated for goods movement and would require significant operating costs. These technologies are also subject to some regulatory restrictions on their use. A zero-emissions demonstration program (PC AQ-11) is considered as a project condition, as described further under impact AQ-7 for health risk.

Zero-Emissions and Hybrid Trucks – this mitigation measure was considered and determined to be technically infeasible. A technical discussion is provided in Section 5.2.2 of the RDEIR. Zero emission truck technology has been studied by the Port for technical feasibility and application to Port-specific uses, including the heavy-duty drayage trucks calling on the Port terminals and the Port-specific drayage truck duty cycle (TIAX, 2011). The conclusion of the study is that this technology has not been demonstrated to adequately meet the technical requirements of Port drayage trucks for gradeability and top speed. Hybrid diesel-electric trucks are an emerging technology, and several manufacturers offer hybrid diesel-electric truck models as Class 6 or 7 heavy-duty on-road trucks (HVIP, 2011). At this time, only Peterbilt manufactures a Class 8 hybrid diesel-electric truck, but this truck model has not been...
tested for use in Port-specific applications or for the Port-specific drayage truck duty cycle. The Port’s study of zero-emission and hybrid trucks indicate that the weight classes of hybrid truck currently available may not meet the requirements of Port drayage trucks. In addition, at this time there is insufficient data to characterize the emissions of hybrid trucks on a modal basis, including using standard testing duty cycles, Port-specific drayage truck duty cycles, or by-speed emissions. Some studies have modeled the potential benefits of hybrid diesel-electric trucks but are focused on the fuel economy benefits of the technology and have not considered the impacts of hybrids on criteria pollutant emissions (NESCCAF, ICCT, SwRI, TIAx, 2009). Without detailed data on hybrid truck emissions performance, it is not possible to model these emissions accurately for use in air quality environmental analysis. A zero-emissions demonstration program (PC AQ-11) is considered as a project condition, as described further under impact AQ-7 for health risk.

Nevertheless, the LAHD is committed to mitigating operational emissions to the maximum extent feasible as demonstrated by MM AQ-8 (Low-Emission Drayage Trucks), MM AQ-9 (Periodic Review of New Technology), and MM AQ-10 (Substitution of New Technology), which are further discussed below under Impact AQ-7 in Section 4.3.1 of this document.

4.2.3 Cultural Resources

As discussed in Section 3.4 of the DEIR, there would be one significant and unavoidable impact to Cultural Resources as a result of the proposed Project.

Impact CR-2: Construction of the proposed Project would cause a substantial adverse change in the significance of a historical resource as defined in §15064.5

The Sepulveda Boulevard Bridge is the only known historical resource in the Project area, as defined by CEQA Guidelines § 15064.5. The proposed Project would demolish and replace the bridge, thereby eliminating its historic materials and integrity. The replacement of the bridge is necessary because the existing bridge cannot accommodate three tracks.

In February and March 2011, the LAHD and BNSF undertook an effort (M&N, 2011) to locate an entity interested in accepting the bridge, or culturally significant elements of it (e.g., the abutment facades and the Warren truss sections). A number of local government agencies and construction companies were contacted to assess the potential for the bridge being reused in part or whole at another location, but none of the entities was interested in accepting the bridge nor did any know of any potential uses for the bridge.

There is no reasonable expectation that the Sepulveda Boulevard Bridge can be salvaged in its entirety for use elsewhere in the region, and the bridge cannot be retained in its present location. The proposed Project would result in a significant impact on a historical resource because it would materially alter, in an adverse manner, the physical characteristics of the bridge that convey its historical significance and justify its eligibility for inclusion in the CRHR. Implementation of mitigation measures MM CR-2 and MM CR-3 would be required in order to reduce the substantial adverse impact to the Sepulveda Boulevard Bridge that would result from the proposed Project.
Finding

The Board hereby finds that changes or alterations have been required in, or incorporated into the project that avoid or substantially lessen the significant environmental effect identified in the FEIR. Implementation of mitigation measures MM CR-2 and MM CR-3 would reduce adverse effects to the historical resource, but the impact would remain significant and unavoidable. Specific economic, legal, social, technological, or other considerations make infeasible any additional mitigation measures.

MM CR-2: Prior to the start of construction of the new Sepulveda Boulevard railroad bridge, BNSF will prepare archival documentation and an interpretative display of the historical resource.

Documentation: A Historic American Engineering Record (Level II or less) will be prepared to provide a physical description of the historic bridge, discuss its significance under applicable CRHR criteria, and address the historical context for its construction, purpose, and function. Large-format black and white photographs will be taken showing the Sepulveda Boulevard Bridge in context, as well as details of its historic engineering features. The photographs will be fully captioned and processed for archival permanence. Copies of the report will be offered to the local historical society and any other repository or organization determined by LAHD.

Interpretive Display: An interpretive exhibit, in the form of a permanent plaque, will be prepared, and once construction of the new bridge is complete, the plaque will be installed at the bridge site that provides a brief history of the structure, a description of its engineering features and characteristics, and the reasons for and date of its demolition and replacement.

MM CR-3: Prior to the start of the Sepulveda Bridge component of the proposed Project, BNSF shall prepare a plan for salvaging noteworthy elements of the structure for re-use either elsewhere or in the new bridge. The plan shall identify the elements to be salvaged, which shall be determined in consultation with a qualified architectural historian. Suitable re-use would include as decorative elements either on the new bridge or elsewhere in the region, or as an interpretive display. The plan shall be approved by LAHD, and the existing bridge and abutments shall not be demolished or altered until said approval has been granted.

Rationale for Finding

As discussed above, the replacement of the bridge is necessary to support the proposed Project. In an attempt to preserve the historical character of the bridge, LAHD and BNSF approached a number of local government agencies and construction companies to assess the potential for the bridge being reused in part or whole at another location. However, none of the contacted entities were interested in accepting the bridge and were not aware of any potential uses for the bridge.

Nevertheless, despite no agency willing to accept the bridge or its historically significant attributes, mitigation measure MM CR-3 requires the preparation of a plan for salvaging the noteworthy elements of the structure for reuse elsewhere or in the new bridge constructed as part of the proposed Project.

Mitigation measure MM CR-2 was also incorporated to mitigate the significant impact on the Sepulveda Bridge, a historic resource. As described in further detail above, MM CR-2 requires the preparation of a Historical American Engineering Record.
Changes or alterations have been required in or incorporated into the project in the form of mitigation measures MM CR-2 and MM CR-3 which would reduce adverse effects to the historical resource, but the impact would remain significant and unavoidable. No further feasible mitigation is available to reduce this impact to less than significant.

### 4.2.4 Greenhouse Gas Emissions and Climate Change

As discussed in Section 3.6 of the RDEIR, there would be one significant and unavoidable impact to Greenhouse Gas Emissions and Climate Change as a result of the proposed Project.

**Impact GHG-1: The proposed Project would result in an increase in construction-related and operation-related GHG emissions.**

The major sources of GHG from Project construction and operation are combustion of fossil fuels and electricity usage, as detailed in Tables 3.6-3 and 3.6-4 of the RDEIR. Where there are no established significance thresholds, the Port has conservatively established, for purposes of the EIR, that any increase is potentially significant and is treated accordingly. Therefore, significant impacts would occur for the Proposed Project construction and operation activities.

For construction, emissions for each construction element were determined by totaling the daily emissions from the individual construction activities and alternate business location operational activities that overlap in the proposed construction schedule. For operation, baseline annual emissions are compared to future annual operational emissions to determine CEQA significance for the proposed Project.

GHG emissions from Project construction would be a significant impact under CEQA. The proposed project would produce GHG operational emissions that would exceed the CEQA baseline levels when the project reaches its full capacity in 2035 and beyond. However, operational emissions would be less than the baseline GHG emissions through 2023 before the SCIG facility throughput reaches its maximum capacity. Therefore, significant impacts under CEQA would occur for the proposed Project.

Mitigation measures MM AQ-1 through MM AQ-7 would have either negligible effects on reducing GHG emissions or could not be reasonably quantified. A number of project features reduce GHG emissions, including the use of wide-span electric RMG cranes, idle reduction devices for locomotives, the SCIG administration building which will be LEED certified, and LEED certified replacement buildings constructed at the alternate sites for businesses that are greater than 7,500 square feet in size. The following mitigation measures MM GHG-1 through MM GHG-10 for the SCIG facility would reduce GHG emissions from electricity generation or fossil fuel combustion. Some of these mitigation measures would also apply to certain businesses moving to alternative sites on property owned by POLA, both during construction and operations.

**Finding**

The Board hereby finds that changes or alterations have been required in, or incorporated into, the project that avoid or substantially lessen the significant environmental effect identified in the FEIR. However, as the mitigation measures would not reduce emissions to their baseline levels, incorporation of these mitigation measures would not reduce
GHG emissions below significance. Specific economic, legal, social, technological, or other considerations make infeasible any additional mitigation measures.

**MM GHG-1: Idling Restriction and Electrification for Construction Equipment.** Construction equipment idling will be restricted to a maximum of 5 minutes when not in use. Prior to construction and at the time of contract bid specification, the availability and use of electrified construction equipment shall be considered and implemented where feasible.

**MM GHG-2: Solar Panels.** The Port shall require installation of solar panels on all buildings constructed on POLA property where feasible. The Port, in consultation with the Tenant, will undertake a feasibility review and will make a determination as part of the Tenant(s) final design on the solar panel requirement.

**MM GHG-3: Recycling.** The Tenant shall ensure a minimum of 40 percent of all waste generated during project construction is recycled and that 70 percent of all waste generated in all Tenant buildings is recycled at the start of operations and 100 percent is recycled by 2025. The goals for operational recycling are consistent with, but more ambitious, than the City of Los Angeles Bureau of Sanitation’s Solid Resources Citywide Recycling Division’s goal of 70 percent waste diversion by 2020 (Bureau of Sanitation, 2000) and RENEW LA’s goal of 90 percent by 2025 (RENEW LA, 2005). Recycled materials shall include: (a) white and colored paper; (b) post-it notes; (c) magazines; (d) newspaper; (e) file folders; (f) all envelopes including those with plastic windows; (g) all cardboard boxes and cartons; (h) all metal and aluminum cans; (i) glass bottles and jars; and; (j) all plastic bottles.

**MM GHG-4: Tree Planting.** Once construction is completed at the SCIG facility, the Tenant shall plant shade trees around the main administration building and maintain all trees through the life of the lease.

**MM GHG-5: Water Conservation.** As part of the SCIG facility construction, the Tenant shall install a water recirculation system at potential wash racks, install low-flow devices in new buildings and low irrigation landscaping, and maintain these through the life of the lease.

**MM GHG-6: Energy Efficient Light Bulbs.** In addition to the SCIG facility main administration building, which would be LEED certified, all other interior buildings shall exclusively use energy efficient light bulbs (compact fluorescent (CFL), LED, or other equally efficient) for ambient lighting. The businesses on their alternate locations on Port-owned property shall also maintain and replace any Port-supplied energy efficient light bulbs. CFL and LED bulbs produce less waste heat and use substantially less electricity than incandescent light bulbs.

**MM GHG-7: Energy Audit.** The Tenant shall conduct a third party energy audit every 5 years and install innovative power saving technology where feasible, such as power factor correction systems and lighting power regulators. Such systems help to maximize usable electric current and eliminate wasted electricity, thereby lowering overall electricity use.

**MM GHG-8: Solar Canopy on Parking Area.** The Tenant shall construct a canopy or canopies over the employee parking area at the SCIG facility that shall be equipped with photovoltaic (PV) solar panels for generating on-site electrical power.

**MM GHG-9: Alternative Fuel Service Trucks.** The Tenant shall utilize only alternative-fuel (for example compressed natural gas (CNG), ethanol flex fuel (E85), and
hydrogen fuel, as outlined CARB’s Advanced Clean Cars program (CARB, 2012)) service trucks within the SCIG facility.

**MM GHG-10: Carbon Offsets.** The Tenant shall offset 100% of projected on-site electricity consumption at the SCIG facility over the 50-year lease term from 2016 through 2066, and thus reduce GHG emissions by 117,918 metric tons CO2e through the purchase of carbon offsets such as those available from the California Climate Action Registry’s Climate Action Reserve. In addition, when new GHG emission reduction technology becomes available, it will be reviewed under the same process as MM AQ-9 which requires periodic reviews of emissions-reduction technology and implementation into SCIG operations once the technology is determined to be feasible.

**Rationale for Finding**

Where there are no established significance thresholds, the Port has conservatively established, for purposes of the EIR, that any increase is potentially significant and is treated accordingly.

GHG mitigation measures **MM GHG-1 through MM GHG-10** were not quantified because of the difficulty in determining quantitative future year GHG emissions reductions from these measures. Therefore, the GHG emissions during construction and operation are significant and unavoidable.

Comments were received on the RDEIR regarding additional mitigation to reduce GHG impacts such as funding solar panels on local schools and purchasing carbon offsets. Given there is already mitigation in place to install solar panels and a solar canopy at the SCIG facility, as well as at the alternate business sites, the mitigation measures included in the FEIR are appropriate and installing solar panels on local schools as recommended by a commenter would not be necessary. The recommendation to purchase carbon offsets has been added as a new mitigation measure to the FEIR as **MM GHG-10**.

In addition, the majority of the GHG emissions are associated with the movement of cargo through the Ports of Los Angeles and Long Beach and through the Southern California region generally. These emissions are not appropriately attributable to a single project, but rather associated with movement of cargo by rail and/or truck that would occur regardless of whether the Project is built. The movement of cargo throughout the Southern California region is addressed in the SCAG 2012 RTP and the associated GHG emissions were analyzed in the Programmatic EIR (PEIR) for the 2012 RTP. SCAG concluded that rail is a more fuel efficient means of moving cargo than trucking. The SCIG RDEIR confirms this, finding the No Project Alternative has higher GHG emissions than the Project.

### Land Use

As discussed in Section 3.8 of the RDEIR, there would be one significant and unavoidable impact to Land Use as a result of the proposed Project.

**Impact LU-4: The proposed Project would cause secondary impacts to surrounding land uses**

Secondary impacts refer here to the possible nexus between activities at the proposed Project and land use changes in communities adjacent to the Project site. Activities of
concern would include air emissions, noise, and traffic congestion, any of which, if substantial, could adversely affect residential and sensitive land uses.

The proposed Project would be constructed on land currently zoned for industrial uses and would not require zoning changes. The proposed Project would not induce appreciable immigration or emigration in the adjacent communities. The presence of the proposed SCIG facility would affect future land uses by discouraging siting of certain facilities in West Long Beach. As described in Section 3.8.1.12 and Impact LU-2 of the RDEIR, CARB and SCAQMD guidelines recommend that new sensitive uses, including schools, day care centers, and parks, not be located within 1,000 feet of railyards. State policy also recommends against siting sensitive uses near major freeways. A portion of West Long Beach along the Terminal Island Freeway lies within 1,000 feet of the eastern edge of the proposed Project site. Accordingly, if the proposed Project were built, future proposals to build new schools, parks, and other sensitive uses in that area would conflict with state policy and would need to be located in other parts of West Long Beach. The proposed Project would be constructed on land currently zoned for industrial uses and would not require zoning changes. The proposed Project would not induce appreciable immigration or emigration in the adjacent communities. The project’s level of employment would be small relative to the local job base, so that the new jobs would not result in population growth. Similarly, the businesses that would be displaced by the proposed Project are not major employers; furthermore, those businesses would be expected to relocate in the general area or southern Los Angeles County, within reasonable commuting distance of their present locations, so that their displacement would not cause emigration to other areas.

The proposed Project would cause significant air quality and noise impacts. Therefore, secondary impacts on land use would be considered significant. Mitigation measures would reduce air pollutant emissions and noise impacts, but some would remain significant and unavoidable after mitigation. Future siting of sensitive uses in the portion of West Long Beach adjacent to the Terminal Island Freeway would be precluded by the presence of the proposed Project. However, because other industrial uses in the area and the presence of the Terminal Island Freeway would also discourage such siting, the proposed Project would be contributory to a general prohibition against siting sensitive uses in the area.

Finding

The Board hereby finds that changes or alterations have been required in, or incorporated into, the project that avoid or substantially lessen the significant environmental effect identified in the FEIR. Mitigation measures for air quality and noise impacts have been imposed (MM AQ-1 through MM AQ-10 and MM NOI-1 through MM NOI-3). However, those mitigation measures are not expected to reduce the impacts to less than significant. Specific economic, legal, social, technological, or other considerations make infeasible any additional mitigation measures.

Rationale for Finding

As discussed above, the proposed Project would have significant air quality and noise impacts that could adversely affect residential and sensitive land uses. The proposed Project, however, would not cause changes in patterns of land use in adjacent communities or cause immigration or emigration in response to changing job opportunities. As
explained in more detail above, the proposed Project’s level of employment would be small relative to the local job base, and would not result in population growth.

Pursuant to state guidelines (CARB and SCAQMD), the proposed Project would preclude the siting of sensitive uses in the portion of West Long Beach adjacent to the Terminal Island Freeway. However, because other industrial uses in the area and the presence of the Terminal Island Freeway would also discourage such siting, the proposed Project would be contributory to a general prohibition against siting sensitive uses in the area.

As discussed in SCIG RDEIR Section 3.2, Air Quality, various mitigation measures are incorporated to mitigate impacts to air quality. MM AQ-1, for instance, imposes requirements for modernization of fleet construction equipment. MM AQ-7 requires on-site sweeping at SCIG. Similarly, MM AQ-9 and MM AQ-10 mitigate impacts to air quality by requiring periodic review and consideration of new technology, should the effectiveness of the technology be proven.

A number of the mitigation measures incorporated in Section 3.9, Noise, are also relevant to this impact. Under MM NOI-1, for example, BNSF must construct a permanent soundwall on the easterly right-of-way of the Terminal Island Freeway. MM NOI-2 includes a number of noise control measures that must be implemented during construction of the Project.

As identified in SCIG RDEIR Sections 3.2 and 3.9, the Project would, even with mitigation, have significant impacts related to air quality and noise. For a detailed discussion of why the impacts to air quality and noise, as they are applicable to this impact, could not be mitigated to a less than significant level, please see Section 4.2.2 and 4.2.6 of this document. Because the proposed Project would continue to have significant impacts related to air quality and noise after mitigation, the secondary land use impacts would remain significant and unavoidable. No further feasible mitigation is available to reduce this impact to less than significant as noted in the findings for each environmental resource area with significant and unavoidable impacts.

4.2.6 Noise

As discussed in Section 3.9 of the RDEIR, there would be one significant and unavoidable impact to Noise as a result of the proposed Project.

Impact NOI-6: Construction and operation of the proposed Project would cause ambient noise levels to be increased by three dBA or more, or maximum noise levels allowed by the Long Beach Municipal Code would be exceeded.

Construction

The analysis of construction-related noise levels in the City of Long Beach included data from twelve different receptor locations. Table 3.9-22 of the RDEIR presents the worst-case daytime construction noise levels expected, assuming all construction elements occur simultaneously. Exterior daytime construction noise levels (L50) from the proposed Project would be expected to be as high as 63.5, 65.8, 70.2, 70.4, 57.8, 70.9, 68.8, 62.9, 66.1 and 57.5 dBA at the Webster residence, Buddhist Temple, Hudson School, Hudson Park, Cabrillo High School, Cabrillo Child Development Center, Bethune School, the Century Villages at Cabrillo, Cabrillo Park, and Stephens Middle School, respectively.

The construction noise levels would exceed ambient noise levels by more than 3 dB at
each of these receptor locations. The future daytime construction noise at the Webster School and at Mambo Sound & Recording Studio would be below ambient noise levels and maximum noise levels allowed by the Long Beach Municipal Code. Nighttime construction noise levels from the PCH grade separation would not be expected to be more than 3 dB above ambient levels at any of the receptors.

**Classroom Interior Construction Noise levels**

Future interior noise levels within classrooms were analyzed to assess the impact of Project construction on school facilities. Future interior construction noise levels were calculated by subtracting the measured noise reduction from the predicted exterior construction noise levels from the Project. Interior construction noise levels with ambient noise would be below the LBMC allowable daytime interior noise standard at all educational receivers except for at the Cabrillo Child Development Center. When compared to existing ambient noise levels, future interior construction noise levels would be below existing ambient noise levels within the classrooms with the exception of Bethune School. At this location, a greater than 5 dB increase would be experienced during the heaviest periods of construction activity (although noise levels would not exceed the LBMC 45 dBA noise standard) and would be considered significant.

**On-Site and Rail Corridor Operations**

On-site SCIG operations would generate noise levels ranging from 59 to 95 dBA at a distance of 100 feet from the source. Future rail movements along the San Pedro Branch line would include diesel engine noise, train horns, and railcar noises. According to BNSF, train horn soundings are not expected to occur on the San Pedro Branch line due to the Project’s design features.

Predicted daytime Project on-site and rail corridor operational noise levels at sensitive receivers would result in an increase of 3 dB or greater over existing measured ambient noise levels at the residence at 2789 Webster and at Cabrillo High School. Nighttime on-site and rail corridor operational noise levels would result in an increase of 3 dB or greater over existing measured ambient noise levels at the residence at 2789 Webster, at the Buddhist Temple, and at the Century Villages at Cabrillo. The nighttime noise increases that would be experienced outdoors at the Webster residence, Buddhist Temple and Century Villages at Cabrillo would occur when maximum possible operations coincide with the low background noise. This condition is not expected to occur on a daily basis and for more than one hour in any given 24-hour period.

**Existing Plus Project Traffic Noise Levels**

Table 3.9-18 of the RDEIR summarizes the predicted roadway traffic noise levels once the proposed Project is in full operation. Portions of the following roadways in the City of Long Beach include noise-sensitive land uses that would be expected to experience future traffic noise levels above 70 CNEL: E. Anaheim St., Long Beach Freeway, Pacific Coast Highway, Terminal Island Freeway, W. Anaheim Street, W. Pacific Coast Highway, and W. Willow Street. The majority of roadways within the City would experience a traffic noise decrease as a result of the Project because the Project would reduce truck traffic on roadways north of the Project site. Roadways in Long Beach also would not experience a cumulative noise level increase over existing noise levels of 3 dBA or greater.

**Classroom Interior Operational Noise Levels**

Interior noise levels within classrooms were analyzed to assess the effect of the proposed Project’s on-site and rail corridor operational noise on school facilities. Future interior
noise levels were calculated by subtracting the measured noise reduction from the predicted exterior operations noise levels from the proposed Project. Future operations noise levels would be below the LBMC allowable interior noise standard of 45 dBA. When compared to existing ambient noise levels, future interior operations noise levels would be below existing noise levels within the classrooms.

Impact Determination

At the maximum levels of construction activity, increases in construction noise at sensitive receivers R1 through R7B and R30 (receptor reference provided in Section 3.9 of RDEIR) would be more than 5 dB over existing ambient levels. The increase in construction noise would be temporary and during periods of reduced construction activity, noise levels would be lower. However, because the increase would exceed the threshold, the proposed Project would have a significant impact associated with construction noise.

Portions of East Anaheim Street, West PCH, the Long Beach Freeway and the Terminal Island Freeway would be expected to experience future traffic noise levels above 70 CNEL. Traffic noise levels above 70 CNEL are considered incompatible with noise guidelines. No roadways in Long Beach with noise-sensitive receptors would experience Project-related increases in operational noise exceeding the 3 dBA threshold. While existing noise levels are above 70 CNEL on some roadways, road traffic noise impacts were found to be less than significant because the Project’s contribution would not exceed 3dB at these roadways. In many instances implementation of the Project will reduce noise levels along specific roadway segments as a result of SCIG trucks using designated routes.

Predicted daytime operational noise levels from the proposed Project site would exceed existing measured ambient noise levels by 3 dBA or greater at the residence at 2789 Webster (R1) and at Cabrillo High School (R5). Predicted nighttime exterior operational noise levels would exceed existing ambient noise levels by greater than 3 dB at the residence at 2789 Webster (R1), at the Buddhist Temple (R2), and at the Century Villages at Cabrillo (R7A). These increases represent a significant impact.

Interior noise levels from Project operations would not be expected to exceed municipal code standards for classroom interior spaces. Further, interior operational noise levels would not be expected to approach or exceed existing ambient interior noise levels within active classrooms. Interior construction noise levels would exceed LBMC standards at the Cabrillo Child Development Center (R6) and future noise levels would exceed existing ambient noise levels by greater than 3 dB at the Bethune School (R7); therefore, classroom noise impacts would be significant during construction.

Finding

The Board hereby finds that changes or alterations have been required in, or incorporated into, the project that avoid or substantially lessen the significant environmental effect identified in the FEIR. The following mitigation measures would address significant impacts from construction and operational noise at nearby noise sensitive receptors.  

**MM NOI-1:** Prior to the start of construction of the proposed Project, BNSF shall construct a permanent, 12-foot-high soundwall along the easterly right-of-way of the Terminal Island Freeway, from West 20th Street to Sepulveda Boulevard, as shown in Figure 3.9-6, to reduce construction noise. The final height and location of the soundwall shall be verified by an acoustical consultant as part of the final engineering design of the
soundwall. After construction of the soundwall, BNSF shall install landscaping along the length of the soundwall that would serve as additional screening and a buffer. The final landscaping plan with selected native plant species and irrigation shall be determined as part of the final engineering design. Upon completion, BNSF will be responsible for long-term maintenance. Right-of-way acquisition necessary for the soundwall and landscaping shall be the responsibility of BNSF.

**MM NOI-2:** The following noise control measures shall be implemented during construction of the proposed Project. This mitigation measure applies to BNSF and the businesses that move to the alternate sites. These measures were not quantitatively evaluated.

a. **Construction Hours.** Limit construction to the hours of 7:00 am to 9:00 pm on weekdays, between 8:00 am and 6:00 pm on Saturdays, and prohibit construction equipment noise anytime on Sundays and holidays as prescribed in the City of Los Angeles Noise Ordinance, except where nighttime construction is necessary on the PCH grade separation. For construction activities that occur within the City of Long Beach (e.g., the North Lead Track construction and sound wall construction), limit construction to the hours of 7:00 am and 7:00 pm on weekdays and between 9:00 am and 6:00 pm on Saturdays, as prescribed in the City of Long Beach Noise Ordinance.

b. **Construction Days.** Do not conduct noise-generating construction activities on weekends or holidays unless critical to a particular activity (e.g., concrete work).

c. **Temporary Noise Barriers.** When construction is occurring within 500 feet of a residence or park, temporary noise barriers (solid fences or curtains) shall be located between noise-generating construction activities and sensitive receptors unless and until the soundwall provided in MM NOI-1 has been built or the construction noise management plan (see (l) below) demonstrates that temporary barriers are not necessary.

d. **Construction Equipment.** Properly muffle and maintain all construction equipment powered by internal combustion engines.

e. **Idling Prohibitions.** Prohibit unnecessary idling of internal combustion engines near noise sensitive areas.

f. **Equipment Location.** Locate all stationary noise-generating construction equipment, such as air compressors and portable power generators, as far as is practical from existing noise sensitive land uses.

g. **Quiet Equipment Selection.** Select quiet construction equipment whenever possible.

h. **Notification.** Notify residents near the proposed Project site and within at least a one mile radius of the Project site of the construction schedule in writing (in both English and Spanish, and other languages if necessary) via brochures, mailings, community meetings, and a project website.

i. **Portable Generators.** Avoid the use of portable generators if electricity can be obtained from the local power grid.

j. **Noise Complaints.** Assign a construction liaison to respond to noise complaints. Post contact information at the construction site in public notices, and on a project website.

k. **Pile Driving Hours.** Restrict pile driving to the hours between 9 AM and 5 PM, Monday through Friday, and from 10 AM to 4 PM on Saturdays.
1. A Construction Noise Monitoring and Management Plan for the SCIG facility will be required prior to the commencement of any construction activity. The plan should evaluate each piece of construction equipment and the need for administrative and engineering noise control for each type of construction equipment. A noise monitoring plan should be prepared to document construction noise levels during the process.

MM NOI-3: Prior to the start of construction, BNSF shall first construct a permanent 24-foot high sound barrier as an extension to the existing 24-ft high sound barrier along the easterly right-of-way of the San Pedro Branch rail line north of Sepulveda Blvd, as shown in Figure 3.9-6. The barrier would close the present gap between the existing barrier and a warehouse to the south, removing line-of-sight from the Project site to receiver R1 (the residence at 2789 Webster) and receiver R30 (Stephens Middle School). The final height and location of the soundwall shall be verified by an acoustical consultant as part of the final engineering design of the soundwall Right-of-way acquisition necessary for the soundwall shall be the responsibility of BNSF.

With implementation of MM NOI-1, MM NOI-2, and MM NOI-3, construction equipment noise and daytime operations noise generated by the proposed Project would be reduced to the point that impacts would be less than significant after mitigation. However, nighttime operations noise with mitigation would remain significant and unavoidable when “high activity” operations (haul trucks, yard tractors, container loading and unloading, train building, and servicing activities) coincide with extremely low nighttime ambient noise levels. Full implementation of MM NOI-1, MM NOI-2, and MM NOI-3 would reduce the construction noise levels to comply with the Long Beach Noise Ordinance standard and CEQA increase thresholds. Tables 3.9-27 and 3.9-28 of the RDEIR list the reduced construction and operational noise, respectively, with 12-ft and 24-ft permanent soundwalls in place. Specific economic, legal, social, technological, or other considerations make infeasible any additional mitigation measures.

Rationale for Finding

Changes or alterations have been required in or incorporated into the Project in the form of mitigation measures MM NOI-1 through MM NOI-3 which would reduce noise impacts, but nighttime exterior operations noise would remain significant and unavoidable. No further feasible mitigation is available to reduce this impact to less than significant. For additional details please see RDEIR Chapter 3.9, including revisions in the FEIR Chapter 3 “Modifications to the DEIR and RDEIR”, and FEIR Response to Comment R89-66.

### 4.3 Findings Regarding Significant Environmental Impacts Found to Be Less Than Significant After Mitigation

The following Findings pertain to significant environmental impacts of the Project for which mitigation measures have been identified in the FEIR which will avoid or substantially lessen the significant environmental effects to below a level of significance.
4.3.1 Air Quality and Meteorology

As discussed in Section 3.2 of the RDEIR, there would be one significant impact to Air Quality and Meteorology that would be mitigated to less than significant as a result of mitigation measures incorporated into the Project.

Impact AQ-7: The Project would expose receptors to significant levels of TACs.

Following the “Air Toxics Hot Spots Program Risk Assessment Guidelines” developed by the Office of Environmental Health Hazard Evaluation (OEHHA) within the CAL/EPA (OEHHA, 2003) and risk assessment guidance developed by the SCAQMD, POLA developed a Health Risk Assessment (“HRA”) Protocol (POLA, 2008) for the SCIG Project spanning 2013-2082, Consistent with the HRA protocol, human health risks associated with the emissions of TACs from the Project were estimated. Following risk assessment guidance for CEQA, health risks for both the Project-related emissions as well as the emissions from baseline conditions in 2010 were estimated and the difference was reported as the incremental health risks associated with the Project.

The CEQA Guidelines state that the baseline for environmental analysis is normally "the physical environmental conditions in the vicinity of the project, as they exist at the time the notice of preparation is published" (CEQA Guidelines §15125a). As explained in Section 3.2.2.3 of the RDEIR, the LAHD has determined that the time of the notice of preparation (2005) does not represent existing conditions. The significance of Air Quality impacts under CEQA are evaluated in comparison with a 2010 baseline.

Neither CEQA case law nor the CEQA Guidelines mandate a uniform, inflexible rule for determination of the existing conditions baseline. Rather, a lead agency has the discretion to decide exactly how existing physical conditions without the project can most realistically be measured. For instance, environmental conditions can vary from year to year and in some cases it may be necessary to consider conditions over a range of time periods. The Sunnyvale West Neighborhood Association v. City of Sunnyvale (2010) 190 Cal. App. 4th 1351, 1382-1383 (Sunnyvale West) case, and subsequent decisions, Pfeiffer v. City of Sunnyvale City Council, 200 Cal.App.4th 1522, 1537 (and Neighbors for Smart Rail v. Exposition Metro Line Construction Authority, petition for review granted by California Supreme Court, Case Number S202828, (Neighbors for Smart Rail), make clear that CEQA review which includes comparison to the static CEQA baseline may also include discussions of foreseeable changes and expected future conditions, where such an analysis is helpful to an intelligent understanding of the project's environmental impacts.

The Project's Cancer Risk impacts would differ if compared to the CEQA 2010 existing conditions baseline versus if compared against expected future conditions surrounding the Project (the "floating baseline"). Therefore, to fully apprise the public and decision makers of the Project's environmental impacts, this document compares the Project's health risk impacts against both the CEQA 2010 existing conditions baseline and the floating or future baseline. The floating baseline used for analysis of the Project's health risk impacts incorporate the effects of reduced emissions that would result from planned future air quality regulations, but assumes that activities of existing businesses remain at baseline levels. The HRA is presented in comparison against the floating baseline, and feasible mitigation measures and/or project conditions are considered to address impacts.
The period 2013-2082 is the 70-year exposure period with the greatest combined DPM emissions from the Project construction and operation. In addition, the HRA evaluated the cancer impact of project emissions to workers based on average emissions calculated over a 40-year period (years 2013 to 2052) and evaluated the cancer impact to students based on peak annual emissions for an exposure duration of six years. The HRA was used to evaluate potential health impacts to the public from TACs generated by the construction and operation of the Project. Methodologies as specified in the Air Toxics Hot Spots Program Risk Assessment Guidelines were used to perform health risk calculations based on output from the AERMOD dispersion model (OEHHA, 2003). The residential cancer risk estimates are based on an 80th percentile breathing rate, which has been identified by OEHHA and the CARB as providing health-protective estimates of exposure and risk for residential receptors (CARB, 2003). The complete HRA report is included in Appendix C3 of the RDEIR.

The HRA evaluated three principal health effect endpoints: individual lifetime cancer risk, chronic non-cancer effects, and acute non-cancer effects. For the determination of significance under CEQA, the HRA determined the incremental change in health effect endpoints due to the Project by estimating the net change in impacts between the proposed Project and floating baseline conditions.

As quantified in Table 3.2-33 in the RDEIR, the floating or future cancer risk increments at the locations of the maximum exposed individual (MEI) exceed the significance thresholds for residential, occupational, sensitive, and recreational receptors.

Finding

The Board hereby finds that changes or alterations have been required in, or incorporated into the project that avoid or substantially lessen the significant environmental effect identified in the FEIR. Implementation of mitigation measures MM AQ-1 and MM AQ-2 would reduce the impacts from the proposed Project by reducing emissions from construction equipment operating at the Port pursuant to LAHD Construction Guidelines. In addition, MM AQ-8 on low-emission drayage trucks, MM AQ-9 on periodic review of new technologies, and MM AQ-10 on substitution of new technologies would also reduce Project health risk impacts. Additionally, two project conditions, PC AQ-11 and PC AQ-12, though not required as CEQA mitigations, are considered. All mitigations and project conditions are described in detail below.

MM AQ-1: Fleet Modernization for Construction Equipment.

- Tier Specifications:

   From January 1, 2012 to December 31, 2014: All off-road diesel-powered construction equipment greater than 50 hp, except marine vessels and harbor craft, will meet Tier-3 off-road emission standards at a minimum. In addition, all construction equipment greater than 50 hp will be retrofitted with a CARB-verified Level 3 DECS. Any emissions control device used by the contractor shall achieve emissions reductions that are no less than what could be achieved by a Level 3 diesel emissions control strategy for a similarly sized engine as defined by CARB regulations.

   From January 1, 2015 on: All off-road diesel-powered construction equipment greater than 50 hp, except marine vessels and harbor craft, will meet Tier-4 off-road emission standards at a minimum. Any emissions control device used by the contractor shall achieve emissions reductions that are no less than what could be achieved by a Level 3
Los Angeles Harbor Department

Findings of Fact and Statement of Overriding Considerations

MM AQ-2: Fleet Modernization for On-Road Trucks.

Trucks used in construction will be required to comply with EPA Standards as described below:

- For On-road trucks with a gross vehicle weight rating (GVWR) of at least 19,500 pounds: Comply with USEPA 2010 on-road emission standards for PM10 and NOx (0.01 grams per brake horsepower-hour (g/bhp-hr) and 0.2 g/bhp-hr or better, respectively).
- A copy of each unit’s certified EPA rating and each unit’s CARB or SCAQMD operating permit, will be provided at the time of mobilization of each applicable unit of equipment.
- Trucks hauling material such as debris or any fill material will be fully covered while operating off Port property. This mitigation measure was not quantified in the mitigated construction emissions.
- Idling will be restricted to a maximum of 5 minutes when not in use. This mitigation measure was not quantified in the mitigated construction emissions.
MM AQ-8: Low-Emission Drayage Trucks.

This measure would require drayage trucks calling on the SCIG facility to meet an emission reduction in diesel particulate matter emissions (DPM) of 95% by mass relative to the federal 2007 on-road heavy-duty diesel engine emission standard ("low-emission" trucks). Any technology meeting the emissions standard of a 95% reduction in DPM emissions relative to the MY2007 on-road truck standard is applicable in this mitigation measure. The phase-in schedule for low-emission drayage trucks is shown in Table 3.2-34 of the RDEIR.

BNSF will be required to specify in their drayage contracts that all drayage trucks calling on the SCIG facility shall use dedicated truck routes and GPS devices and shall meet the requirements specified above and will incorporate the fleet mix into the operations by the end of the specified years through the term of the lease. BNSF will be required to install Radio-Frequency Identification (RFID) readers to control access at the gate to the SCIG facility. Truck logs and throughput volume will be provided to the LAHD Environmental Management Division for tracking and reporting.

These trucks were modeled as liquefied natural gas (LNG) diesel pilot ignition heavy-duty drayage trucks in the mitigated Project HRA. In the event that throughput volume at the SCIG facility increases beyond the levels that were analyzed for any specific future year, the LAHD will evaluate the impacts of the increased throughput and determine if the phase-in schedule must be accelerated beyond that shown in Table 3.2-34 of the RDEIR.

The Port shall require BNSF to review, in terms of feasibility, any Port-identified or other new emissions-reduction technology, and report to the Port. Such technology feasibility reviews shall take place at the time of the Port’s consideration of any lease amendment or facility modification for the Project site. If the technology is determined by the Port to be feasible in terms of cost, technical and operational feasibility, BNSF shall implement such technology.

Potential technologies that may further reduce emission and/or result in cost-savings benefits for BNSF may be identified through future work on the CAAP. Over the course of the lease, BNSF and the Port shall work together to identify potential new technology. Such technology shall be studied for feasibility, in terms of cost, technical and operational feasibility.

As partial consideration for the Port agreement to issue the permit to BNSF, BNSF shall implement not less frequently than once every five (5) years following the effective date of the permit, new air quality technological advancements, subject to mutual agreement on operational feasibility and cost sharing, which shall not be unreasonably withheld. The effectiveness of this measure depends on the advancement of new technologies and the outcome of future feasibility or pilot studies.

MM AQ-10: Substitution of New Technology.

If any kind of technology becomes available and is shown to be as good or as better in terms of emissions reduction performance than an existing measure, the technology could replace the existing measure pending approval by the Port. The technology’s emissions reductions must be verifiable through USEPA, CARB, or other reputable certification and/or demonstration studies to the Port’s satisfaction.
PC AQ-11: Zero Emission Technologies Demonstration Program.

This project condition would require BNSF to work with the Port of Los Angeles to advance zero emission technologies, consistent with the Port’s 2012-2017 Strategic Plan objective for the advancement of technology and sustainability, and that BNSF shall, as follows:

- Provide match funding to the Clean Air Action Plan Technology Advancement Program (TAP) zero emissions programs in an amount equal to that provided by the Port of Los Angeles up to a maximum of $3 million for purposes of zero emission drayage truck, cargo handling equipment, and proof-of-concept rail technologies demonstration.

- Implement an expeditious phase-in of zero emission drayage trucks and other zero emission technologies into the specification for vehicles serving SCIG operations following a determination of technical and commercial feasibility made by the Ports of Los Angeles and Long Beach Boards of Harbor Commissions consistent with criteria developed by the TAP Advisory Committee (TAP AC) in consultation with the project applicant and approved by the Ports of Los Angeles and Long Beach Boards of Harbor Commissions. In making any finding of technical and commercial feasibility, the Ports shall determine that such equipment or technology:
  - is commercially practicable;
  - has been successfully tested in similar conditions;
  - has been operationally proven in similar revenue service; and
  - is available in sufficient quantities to meet any such requirement

The phase-in shall:
  - Occur at a rate recommended by the TAP AC consistent with the feasibility criteria;
  - Be approved by the Ports of Los Angeles and Long Beach Board of Harbor Commissions consistent with the feasibility criteria; and
  - Lead to the requirement that only zero emission drayage trucks would operate at the SCIG facility.

**Long-term goal**: All drayage trucks operating at the SCIG facility shall be 100% zero emissions by the end of 2020.

- Participate in a zero emissions technologies industry stakeholder group that would assist in the development of technical and commercial criteria for determination of feasibility of zero emission equipment, and advise and support demonstrations of zero emission drayage truck, cargo handling equipment, and proof of concept rail technologies in port-related operations as coordinated and directed by staff of the two ports through the TAP.

- Such demonstrations shall be performed using an appropriate railyard identified by the TAP until such time that SCIG is built, and thereafter BNSF shall allow zero emission technologies tested under the TAP zero emissions program to operate using the SCIG facility once it is constructed. BNSF shall allow TAP representatives access into portions of the SCIG facility where the zero emission equipment is being tested for the purpose of test evaluation, all subject to reasonable notice, compliance
with the BNSF safety and operational rules, and without interference with facility
operation.

- Criteria for evaluation of the results of all demonstrations shall be developed by the
  TAP AC in consultation with the project applicant regarding any equipment to be
  serving the SCIG facility and submitted for approval to the Ports of Los Angeles and
  Long Beach Board of Harbor Commissions. Such criteria shall include, but not be
  limited to: technical practicability, commercial reasonableness, operationally proven,
  and commercial availability. Evaluation of the results of demonstration testing shall
  be performed by the TAP in conjunction with the applicant. Recommendations
  regarding the technical and commercial feasibility of these vehicles shall be
  presented by the TAP to the Ports of Los Angeles and Long Beach Board of Harbor
  Commissions for approval.

**Near-term goal:** The TAP will develop an action plan by 2014 that outlines key
strategies for the advancement of zero emission drayage trucks, including all
criteria for evaluation of technical, commercial and operational feasibility, and
identification of an appropriate railyard to support zero emission drayage truck
demonstration projects starting in 2015.

**Near-term and long-term goal:** Starting in 2015, the TAP shall conduct
periodic evaluations of zero emission truck demonstrations on a reoccurring basis
at least every two years until such time that the Ports of Los Angeles and Long
Beach Board of Harbor Commissioners determine that the vehicles are
technically and commercially feasible. The results of the regular evaluations
shall be documented, including the analysis and conclusions as verified by the
TAP, and shall be presented to the Ports of Los Angeles and Long Beach Board
of Harbor Commissioners.

**PC AQ-12: San Pedro Bay Ports CAAP Measure RL-3.**

CAAP measure RL-3 establishes the goal that the Class 1 locomotive fleet associated
with new and redeveloped near-dock rail yards use 15-minute idle restrictors, use ULSD
or alternative fuels, and meet a minimum performance requirement of an emissions
equivalent of at least 50 percent Tier 4 line-haul locomotives and 40% Tier 3 line-haul
locomotives when operating on port properties by 2023. In March of 2008, USEPA
finalized a regulation which established a 2015 date for introduction of Tier 4
locomotives. There is no regulatory mechanism in place that would mandate the early
production or sale of Tier 4 locomotives prior to 2015. Additionally there is no
requirement to turn fleets over to Tier 4, when it becomes available. Implementation of
the RL-3 goal for the locomotives calling at SCIG while on port properties would be
based on the commercial availability of operationally proven Tier 4 locomotives in 2015
and any adjustment in that date will require equivalent adjustment in the goal
achievement date. The RL-3 emissions goal for locomotives calling on SCIG while on
port properties may also be achieved by BSNF’s reduction in air emissions anywhere in
the South Coast Air Basin equivalent to the RL-3 goal for locomotives calling at SCIG
while on port properties through any other alternative means. RL-3 further establishes
the goal that, by the end of 2015, all Class 1 switcher locomotives operating on port
property will meet USEPA Tier 4 non-road standards. In September 2009, CARB
adopted its “Staff Recommendations to Provide Further Locomotive and Rail yard
Emission Reductions” (CARB, 2009d) which identified several high priority strategies
for reducing emissions from locomotive operations in California, including providing
support for the ports “to accelerate the turnover of cleaner Tier 4 line-haul locomotives
serving port properties as expeditiously as possible following their introduction in 2015, with the goal of 95 percent Tier 4 line-haul locomotives serving the ports by 2020.” Thus, with the assistance of the ports’ regulatory agency partners and in concert with CARB’s stated goals, measure RL3 will support the achievement of accelerating the natural turnover of the line-haul locomotive fleet.

**Rationale for Finding**

Mitigation measures MM AQ-1, MM AQ-2, and MM AQ-8 were quantified and included in the mitigated construction emissions. As a result, the floating increment MEI risks are below the significance threshold for all categories of receptors, as shown in Table 3.2.35 of the RDEIR. The residual impacts would be less than significant. In addition, the implementation of MM AQ-9, MM AQ-10, PC AQ-11, and PC AQ-12 would also contribute to the advancement of LAHD’s environmental goals and objectives.

Emissions will largely come from on-road trucks, and locomotives. As part of the RDEIR, mitigation was developed aiming at reducing these emissions through requiring a phase-in of low-emission trucks meeting a 95% reduction in diesel PM emissions beyond those of the EPA 2007 on-road emission standards for heavy-duty trucks (MM AQ-8), and mitigation measures for construction (MM AQ-1 through MM AQ-6). These mitigation measures were found to reduce the health risk impacts to less than significant.

**4.3.2 Biological Resources**

As discussed in Section 3.3 of the DEIR, there would be one significant impact to the Biological Resources that would be mitigated to less than significant levels as a result of mitigation measures incorporated into the Project. The impacts and mitigation measures are discussed below.

**Impact BIO-1a: Construction activities of the proposed Project would result in the loss of individuals of, or have a substantial adverse effect, either directly or through habitat modifications, on any federally listed critical habitat or species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the CDFG or USFWS.**

Designated critical habitat, sensitive terrestrial mammal species, sensitive aquatic wildlife species, and sensitive plants are not known or not likely to occur in the Biological Survey Area (BSA). However, three California wildlife species of special concern (double-crested cormorant, California brown pelican, and California gull) are known or likely to occur on the BSA during general wildlife surveys. These species could perch and may forage onsite, but the BSA does not contain suitable nesting habitat any for the sensitive species. Accordingly, clearing, grading, and construction would not result in loss of habitat for those species. They could be affected by the noise from pile driving, but they are also habituated to human activity, so that general construction noise, which would be added to the ambient industrial and traffic background, would not have a substantial adverse effect on those species. There is a potential for sensitive bat species to utilize the Dominguez Channel within the BSA as feeding habitat and to roost in palms west of the Terminal Island Freeway or in the Pacific Coast Highway Bridge and Dominguez Channel Bridge. Loss of trees and modifications to bridges could remove potential bat...
roosting habitat. Any fish or mammals that did come into the area would be expected to swim away from the immediate vicinity of construction activities, including pile-driving, before sustaining injury.

Construction could also affect wildlife species not considered candidate, sensitive, or special status, through loss of habitat and behavioral modifications in response to noise, physical disruption, and turbidity. Marine organisms living on the rip-rap and on the channel bottom in the immediate vicinity of construction in the Dominguez Channel would experience mortality and impaired function during construction, and mobile organisms such as fish and birds would be displaced by the effects of construction such as noise and turbidity. These effects would be temporary, lasting only during the few months of bridge construction. The restoration of pre-construction conditions would allow the recovery of the biological community through recolonization of the attached organisms and return of mobile organisms. Recolonization would begin immediately after construction is completed and could take one to five years for full recolonization. Terrestrial wildlife within the BSA is sparse and accustomed to human activities, including noise, and as a result, the effects would not be substantial. Pile-driving noise would be temporary, and wildlife would be expected to move away from the area in which pile driving occurred. Loss of nesting habitat for local birds would be offset by the creation of new habitat in the form of the intensive landscaping as a Project Condition (PC AES-1) along the eastern side of the Project site.

No sensitive species of fish or other aquatic organisms are present in the BSA. Accordingly, sediment resuspension, turbidity, and noise resulting from construction of the proposed Project would have no impact on sensitive aquatic species. Effects on non-sensitive species would be less than significant because the Dominguez Channel does not represent a rich habitat and the effects would be temporary.

No sensitive plant species are expected to occur in the BSA; accordingly, construction would have no impact on sensitive or listed plant species. No suitable nesting habitat is present on the BSA for any of the bird species of special concern. Accordingly, no sensitive bird species would be adversely affected by project construction, and construction impacts on sensitive bird species would be less than significant. The potential for tree removal and bridge replacement to disturb roosting habitat for sensitive bat species represents a significant impact requiring mitigation.

Vegetation and tree removal would significantly affect other species of nesting birds, if present. Although in the long term the loss of nesting habitat would be more than offset by the creation of intensive landscaping as a Project Condition (PC AES-1), disturbance of active nests would violate the MBTA and result in a significant impact requiring mitigation.

Habitat loss, noise, and physical disruption resulting from Project construction would have less than significant impacts on terrestrial animals other than migratory birds because the poor habitat represented by the project site means that there are likely to be few native organisms present that would be disturbed. Impacts of construction on aquatic wildlife would be temporary and less than significant.

Finding

The Board hereby finds that changes or alterations have been required in, or incorporated into the project that avoid or substantially lessen the significant environmental effect identified in the FEIR. Mitigation measures MM BIO-1a and MM BIO-1b addressing
disturbance of active nests to birds and roosting habitat for sensitive bats are discussed below.

**MM BIO-1a:** Should tree or vegetation removal, or bridge replacement and renovation, within the BSA occur during the breeding season for migratory non-game native bird species (generally March 1 – September 1, but as early as February 15 and as late as September 15 for raptors), weekly bird surveys shall be conducted to detect any protected native birds in the vegetation to be removed and other suitable nesting habitat within 300 feet of the construction work area (500 feet for raptors). The surveys shall be conducted 30 days prior to the disturbance of suitable nesting habitat by a qualified biologist with experience in conducting nesting bird surveys. The surveys shall continue on a weekly basis with the last survey being conducted no more than 3 days prior to the initiation of clearance/construction work. If a protected native bird is found, the Operator shall delay all clearance/construction disturbance activities within 300 feet of nesting habitat (within 500 feet for raptor nesting habitat) until August 31 or continue surveys in order to locate any nests. If an active nest is located, clearing and construction within 300 feet of the nest (within 500 feet for raptor nests) will be postponed until the nest is vacated and juveniles have fledged and when there is no evidence of a second attempt at nesting. Limits of construction to avoid a nest shall be established in the field with flagging and stakes or construction fencing. Construction personnel will be instructed on the sensitivity of the area. The results of this measure shall be recorded to document compliance with applicable State and Federal laws pertaining to the protection of native birds.

**MM BIO-1b:** The following activities shall be required with regard to bat roosting habitat:

- Prior to construction, a qualified biologist shall conduct three focused bat surveys between March and November to conclude presence/absence of roosting bats within Pacific Coast Highway Bridge and Dominguez Channel Bridge. A pre-construction survey for roosting bats shall be performed within 30 days prior to removal of palms within the BSA. If no active roosts are found, then no further action will be warranted. If either a maternity roost or hibernaculum (structures used by bats for hibernation) is present, the measures below will be implemented to avoid and reduce impacts to roosting bats;

- Prior to the anticipated bat roosting season (March to November) exclusionary devices will be installed. Installation of these devices will be completed prior to February 1 (beginning of bird breeding season) and will remain until construction is completed. A pre-clearance survey will be conducted at least one day prior to installing exclusionary devices to determine if bats are present. Exclusionary devices installed will include plastic sheeting, plastic or wire mesh, expanding foam, or plywood sheets. A pre-construction survey will also be completed at least one week prior to construction to verify exclusionary devices are successful and no bats are present. If bats are detected, an agency-approved bat biologist will be consulted to discuss additional measures to exclude bats.

- If active maternity roosts or hibernacula are found in trees or structures to be removed or renovated as part of project construction, the project should be redesigned to avoid the loss of the occupied roost if it is possible to do so. If an active maternity roost is located and the project cannot be redesigned to avoid removal of the occupied palm or structure, demolition should commence before maternity colonies form (i.e., prior to March 1) or after young are volant (flying) (i.e., after July
31). Disturbance-free buffer zones as determined by a qualified biologist in consultation with CDFG should be observed during the maternity roost season (March 1 – July 31).

- If a non-breeding bat hibernaculum is found in a structure scheduled for removal, the individuals should be safely evicted, under the direction of a qualified biologist (as determined by a Memorandum of Understanding that would be negotiated with CDFG), by opening the roosting area to allow airflow through the cavity. Demolition will take place at least one night after initial disturbance for airflow. This action should allow bats to leave during darkness, thus increasing their chance of finding new roosts with a minimum of potential predation during daylight. Structures with roosts that need to be removed will first be disturbed at dusk, just prior to removal that same evening, to allow bats to escape during the darker hours.

- During the duration of bridge construction, alternative bat habitat (e.g., large bat houses) suitable for these species will be provided and installed prior to the roosting season (March to November), in coordination with a qualified biologist, CDFG, and the Port. The design of the alternative bat habitat will be approved by a wildlife biologist familiar with bat roosting requirements. The acceptance of artificial roosts appears to have a higher success rate if the artificial habitat is treated with guano. Guano shall be collected immediately after the bats have vacated the roost in order to maximize the collection of guano. Upon construction of artificial habitat features or artificial structures, they will be treated with an application of guano slurry to maximize their potential for use by bats returning to roost in the bridge.

- Use of the bat alternative habitat will be monitored by a bat specialist every 2 weeks. During the known annual monitoring period (approximately March to November) a determination will be made on the bats’ use of the alternative habitat, which species are present, and the duration of use. If no bats are found to use the alternative habitat by April 30, surveys in the vicinity of the previously occupied bridge will be conducted to determine if bats have relocated to establish another roosting location. A bat specialist will be consulted to determine the limits of this survey area. If no bats are found within the area, it will be assumed they have relocated to an area outside of the vicinity of the bridge or palms, and no additional mitigation shall be required.

- Bridge design will incorporate suitable bat habitat. The bridge design will include roughened concrete and will incorporate appropriately sized (0.75 to 1.25 inches wide, at least 12 inches deep) longitudinal crevices.

- A post-construction survey conducted during the bat roosting season (March to November) will be required to ensure success of the new bat habitat within the restored bridge.

**Rationale for Finding**

Changes or alterations have been required in or incorporated into the project in the form of mitigation measures. With implementation of MM BIO-1a and MM BIO-1b, impacts to nesting birds and roosting bats would be less than significant.

**4.3.3 Cultural Resources**

As discussed in Section 3.4 of the DEIR, there would be two significant impacts to Cultural Resources that would be mitigated to less than significant as a result of
mitigation measures incorporated into the Project. The impacts and mitigation measures are discussed below.

**Impact CR-1: Construction and operation of the proposed Project would potentially disturb, damage, or degrade unknown archaeological or ethnographic resources, and thus cause a substantial adverse change in the significance of such resources as defined in §15064.5.**

Although no archaeological sites were discovered during the field surveys, no evidence of prehistoric or historic archaeological material was identified, no known archaeological sites are recorded within the Project area, and the site has undergone extensive development in the past, including earthmoving and fill placement, the Project area possesses the potential to contain buried archaeological and ethnographic resources.

There are no known recorded burial sites within the Project area. However, other excavations in the vicinity of the proposed Project have uncovered intact prehistoric human burials, just west of the current Project area. Accordingly, the Project area has the potential to contain buried unknown archaeological resources and human remains.

Construction of the proposed Project could disturb, damage, or degrade intact resources and result in significant impacts to previously unidentified archaeological resources that may be eligible for the California Register of Historic Resources (CRHR). Buried resources that were not identified during field surveys could be inadvertently unearthed during ground-disturbing activities that could result in demolition of or substantial damage to significant archeological or ethnographic resources, thus creating a significant impact. As there is potential for the presence of unknown archeological resources and human remains, construction of the proposed Project would have a significant impact.

Project operations would have no effect on archeological or ethnographic resources because no further ground disturbances with the potential to encroach on unknown resources would occur. Therefore, operation of the proposed Project would have no impact on archaeological or ethnographic resources.

**Finding**

The Board hereby finds that changes or alterations have been required in, or incorporated into the project that avoid or substantially lessen the significant environmental effect identified in the FEIR. Mitigation measure **MM CR-1** addressing disturbance of unknown buried or otherwise obscured archaeological or ethnographic resources is discussed below.

**MM CR-1:** An archaeological monitor shall be present during all initial grading and excavation activities at the proposed Project site. In the event any cultural resources are encountered during earthmoving activities, the construction contractor shall cease activity in the affected area until the discovery can be evaluated by a qualified archaeologist in accordance with the provisions of CEQA §15064.5. The archaeologist shall complete any requirements for the mitigation of adverse effects on any resources determined to be significant and implement appropriate treatment measures. The treatment plan may include methods for: (1) subsurface testing after demolition of existing buildings, (2) data recovery of archaeological or ethnographic deposits, and (3) post-construction documentation. A detailed historic context that clearly demonstrates the themes under which any identified subsurface deposits would be determined significant would be
included in the treatment plan, as well as anticipated artifact types, artifact analysis, report writing, repatriation of human remains and associated grave goods, and curation.

A preconstruction information and safety meeting should be held to make construction personnel aware of archaeological monitoring procedures and the types of archaeological resources that might be encountered. All construction equipment operators shall attend a pre-construction meeting presented by a professional archaeologist retained by LAHD that shall review types of cultural resources and artifacts that would be considered potentially significant, to ensure operator recognition of these materials during construction.

**Human Remains:** Prior to beginning construction, applicable Native American groups (e.g., the Gabrieliño-Tongva Tribal Council) will be consulted regarding proposed ground-disturbing activities and offered an opportunity to monitor the construction along with the project archaeologist. If human remains are encountered, there shall be no further excavation or disturbance of the site within 100 feet of the find or any nearby area reasonably suspected to overlie adjacent human remains. The Los Angeles County Coroner shall be contacted to determine the age and cause of death of the deceased. If the remains are not of Native American heritage, construction in the area may recommence after authorized by the coroner.

If the remains are determined to be Native American, state laws relating to the disposition of Native American burials that fall within the jurisdiction of the NAHC (PRC §5097) will be implemented by the appropriate parties, which includes contacting the NAHC to determine the most likely living descendant(s) and identifying a mutually acceptable strategy for treating and disposing of, with appropriate dignity, the human remains and any associated grave goods as provided in PRC§5097.98.

If the NAHC is unable to identify a most likely descendant, the descendant fails to make a recommendation within 24 hours of being notified by the NAHC and LAHD and the descendant are not capable of reaching a mutually acceptable strategy through mediation by the NAHC, the Native American human remains and associated grave goods shall be reburied with appropriate dignity on the proposed Project site in a location not subject to further subsurface disturbance.

**Rationale for Finding**

Field surveys and research were conducted as part of the EIR to determine whether any archaeological resources exist on the project site. As discussed above, while no archaeological sites were discovered, no evidence of prehistoric or historic archaeological materials was identified, and the site has undergone extensive development, there is a potential that the project site possesses unknown buried archaeological and ethnographic resources.

To alleviate any potential impact to archaeological or ethnographic resources, MM CR-1 is incorporated. MM CR-1 requires, among other things, that an archaeological monitor be present during initial grading and excavation, and that, if cultural resources are discovered, that the construction contractor cease all activity in the area until the discovery can be evaluated by a qualified archaeologist in accordance with the provisions of CEQA § 15064.5. MM CR-1 also requires consultation with Native American groups prior to beginning of construction, and additionally specifies how to deal with human remains, should they be encountered during construction.
Therefore, the changes or alterations have been required in or incorporated into the project in the form of mitigation, specifically MM CR-1, would reduce residual impacts to less than significant.

**Impact CR-3: Construction of the proposed Project would potentially disturb, destroy, or eliminate access to unknown unique paleontological resources.**

The proposed Project would involve ground disturbing activities, including shallow excavations for utilities and subgrade preparation. Surficial deposits in the Project area consist of younger Quaternary alluvium, probably derived from the Dominguez Channel to the west, as well as artificial fill, all of which have been disturbed by past development. These soils typically do not contain fossils, but they are underlain at a relatively shallow depth by older Quaternary alluvium from which fossils have been recovered to the west across Dominguez Channel. No paleontological resources have been identified within the Project area, which is largely overlain by artificial fill. However, the results of the literature review, as well as the geological setting, demonstrate that the Project area has the potential to contain significant nonrenewable fossil resources.

Implementation of the proposed Project would have a significant impact on previously unidentified paleontological resources because of the potential for permanent loss of or loss of access to a paleontological resource of regional or statewide significance. Grading and excavation associated with Project construction activities would potentially expose subsurface paleontological resources. Any vertebrate fossils exposed by grading without appropriate professional, systematic recovery would be destroyed, and their ability to be preserved for future study would be lost. Accordingly, construction of the proposed Project would have a significant impact on paleontological resources. Operation of the proposed Project would have no impact on paleontological resources because it would not involve ground-disturbing activities.

Because of the Project area’s potential to contain buried paleontological resources, a paleontological monitoring program should be implemented during all initial grading and excavation activities.

**Finding**

The Board hereby finds that changes or alterations have been required in, or incorporated into the project that avoid or substantially lessen the significant environmental effect identified in the FEIR. The following mitigation measure is provided in the event that paleontological resources are encountered during construction. Specific economic, legal, social, technological, or other considerations make infeasible any additional mitigation measures.

**MM CR-4:** Paleontological monitoring of ground disturbing activities shall be conducted by a qualified paleontologist. Ground disturbing activities include, but are not limited to, boring, trenching, grading, and excavating. A preconstruction information and safety meeting will be required to make construction personnel aware of paleontological monitoring procedures and paleontological sensitivity.

In the event that paleontological resources are encountered, the contractor shall stop construction within 10 meters (30 feet) of the exposure. A qualified paleontologist will evaluate the significance of the resource. Additional monitoring recommendations may
be made at that time. If the resource is found to be significant, the paleontologist shall systematically remove and stabilize the specimen in anticipation of its preservation. Curation of the specimen shall be in a qualified research facility, such as the Los Angeles County Natural History Museum.

**Rationale for Finding**

As discussed above, the proposed Project would have a significant impact, before mitigation, on previously unidentified paleontological resources because of the potential for permanent loss or loss of access to a paleontological resource of regional or statewide significance. The Project includes grading and excavation activities that could potentially expose subsurface paleontological resources. Without the incorporation of a paleontological monitoring program, any vertebrate fossils exposed by grading without professional, systematic recovery would be destroyed.

The Project incorporates a paleontological monitoring program, to be implemented during all initial grading and excavation activities. MM CR-4, as discussed above, explains the specific attributes of the program.

Because project construction would be shallow, except for foundation pilings, and because the surficial deposits in the area consists of younger alluvium, no paleontological resources have been identified in the Project area, and the Project site contains previously disturbed artificial fill, MM CR-4 is sufficient to reduce impacts to paleontological resources to a less than significant level.

Changes or alterations have been required in or incorporated into the project in the form of mitigation. Implementation of MM CR-4 would reduce impacts to paleontological resources that may be encountered during project construction to less than significant levels.

### 4.3.4 Utilities and Public Services

As discussed in Section 3.11 of the DEIR, there would be one significant impact to Utilities and Public Services that would be reduced to less than significant by implementing the mitigation measures set forth below.

**Impact PS-6: The proposed Project would not result in an increase in solid waste generation that would exceed the capacity of existing solid waste handling and disposal facilities.**

Construction and demolition associated with the proposed Project would generate debris in the form of concrete, asphalt, structural members, and other building components, some of which would require disposal in a landfill. For the proposed facility, LEED requirements would be implemented which include construction waste management and materials reuse requirements.

During operations the proposed Project is estimated to generate solid waste at a rate of 8.93 lbs/employee/day, according to the Los Angeles CEQA Thresholds Guide (City of Los Angeles, 2006) for a typical industrial facility, which is approximately 1.340 tons/day of non-hazardous waste that would require transportation to the Sunshine County Landfill. Given the regional landfill capacity projections, solid waste generated from Project operations after closure of the Sunshine Canyon Landfill (2030 and after) would represent a significant impact to landfill capacity. It is possible that circumstances
will change in the future, for example, the permitting of additional landfill capacity, the utilization of more distant landfill capacity, and/or the City’s achievement of Zero-Waste solutions. However, for purposes of this analysis, it is assumed that the generation of waste will continue and that additional landfill capacity will not become available.

Solid waste generated by construction activities would be minimized by compliance with AB939 regulations and LEED requirements to recycle asphalt, concrete, and soil, thus impacts to landfill facilities associated with demolition activities would be less than significant.

In the case that hazardous materials are encountered during construction activities, contaminated soil treatment and disposal options and Class I landfills are available for offsite disposal; impacts would be short-term and temporary and would last only for the duration of construction phases. The proposed Project would be required to comply with all existing hazardous waste laws and regulations, including the federal RCRA and Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA), and CCR Title 22 and Title 26. Therefore, impacts to Class I solid waste facilities from hazardous construction waste would be less than significant.

Solid waste generation from operation of the proposed Project is not expected to be substantial, as the proposed Project’s primary activity would be handling shipping containers, and minimal administrative facilities would be required to support the proposed operations. Operations would continue through 2046, however, and once the currently-operating regional landfills close (assumed to be in 2030), solid waste from the proposed Project, including the alternate business site activities, would exceed landfill capacity. If more landfill capacity becomes available or waste generation goes to zero, there would be no impact. This analysis, however, assumes that waste generation will continue and additional landfill capacity would not become available. Accordingly, solid waste from the proposed Project would represent a significant impact on solid waste facilities that would require mitigation.

Finding

The Board hereby finds that changes or alterations have been required in, or incorporated into the project that avoid or substantially lessen the significant environmental effect identified in the FEIR. Mitigation measures MM PS-1, MM PS-2, and MM PS-3 would be imposed on the proposed Project to minimize the impacts of construction-related debris in the short term and of operational-phase solid wastes in the future.

MM PS-1: Recycling of Construction Materials. Demolition and/or excess construction materials shall be separated onsite for reuse/recycling or proper disposal. During grading and construction, separate bins for recycling of construction materials shall be provided onsite.

MM PS-2: Materials with Recycled Content. Materials with recycled content shall be used in Project construction where feasible. Chippers onsite during construction shall be used to further reduce excess wood for landscaping cover.

MM PS-3: To ensure adequate long-term solid waste management, the proposed Project will be required to comply with policies and standards set forth in the City’s Solid Waste Integrated Resources Plan (SWIRP) following 2025.

Rationale for Finding
Mitigation measures would be imposed on the proposed Project to minimize the impacts of construction-related debris in the short term and of operational-phase solid wastes in the future. Mitigation Measure MM PS-1 would be implemented not to mitigate a significant environmental impact but rather to promote the appropriate recycling of solid wastes that would be generated during proposed Project construction. Mitigation measure MM PS-2 is provided not to mitigate an identified environmental impact, but rather to support development of recycled material markets, to the extent feasible. Mitigation measure MM PS-3 would mitigate potential impacts to solid waste capacity from Project operation after the anticipated closure of landfills, because the City’s Solid Waste Integrated Resources Plan will set policy regarding landfill capacity, waste generation, and waste stream diversion. Operational impacts to solid waste capacity would be less than significant through approximately 2030, when existing landfills are projected to close. In the long-term, mitigation measure MM PS-3 would reduce solid waste generation, thereby ensuring long-term adequate solid waste management for the proposed Project starting from 2025. Accordingly, long-term impacts to solid waste disposal would be less than significant after mitigation.

4.3.5 Water Resources

As discussed in Section 3.12 of the DEIR, there would be one significant impact to Water Resources that would be reduced to less than significant levels as a result of a mitigation measure incorporated into the Project. The impact and mitigation measure are discussed below.

Impact WR-1a: Construction activities could create discharges that would cause pollution, contamination, or a nuisance as defined in § 13050 of the CWC or cause regulatory water quality standards to be violated.

The potential exists for contaminants to enter the storm drains at the Project site through the following land-based construction activities:

- Some of the soils could require environmental remediation prior to or during the earthwork phase of construction if contamination is discovered. Contaminated soil could enter storm drains during storm events unless control measures (construction best management practices) are implemented.
- Demolition and construction activities would require the use of dust suppression methods (i.e., wet methods) to limit the volume of airborne particulates generated during these activities. Runoff from the spraying of soil and construction materials with water could enter storm drains during storm events unless control measures are implemented.
- Demolition activities may involve disturbance of building materials that contain asbestos and or lead. These contaminants could enter the storm drains during storm events unless control measures are implemented.
- Demolition and/or construction activities could involve spills or releases from associated equipment (e.g., spills during refueling and maintenance activities, oil leaks from equipment). These contaminants could enter storm drains during storm events unless control measures are implemented.

Erosion controls would be used during construction to reduce the amount of soils disturbed and to prevent runoff from entering the storm drain system through practices.
that are tailored to site-specific conditions. A SWPPP would be required prior to the start of construction activities to specify the logistics to minimize erosion and runoff. Standard BMPs, such as soil barriers, sedimentation basins, site contouring, and others listed in Table 3.12-3 of the DEIR would be used during construction activities to minimize loss of site soils to the storm drain system. Also, concrete truck wash water and runoff of any water that has come in contact with wet cement would be contained on site, via barriers, so that it does not run off site.

Reconstruction of the Dominguez Channel Railroad Bridge could result in impacts such as short-term increases in suspended sediments and turbidity levels, decreases in DO concentrations, increases in nutrient concentrations, and increases in dissolved and particulate contaminant concentrations in areas where contaminated sediments would be disturbed by demolition and construction activities. These changes to water quality would be temporary and expected to be confined to the immediate vicinity (e.g., within 300 feet) of in-water construction activities (USACE and LAHD, 2009).

Certification and permits required from the USACE, RWQCB, CDFG, and Los Angeles County (MS4) would include water quality standards that must be met at various distances from the in-water activities and would specify Best Management Practices (BMPs) to be employed during construction.

Based on the history for similar type of work in the port area, accidental leaks and spills of large volumes of hazardous materials or wastes containing metals and PAHs contaminants during construction activities have a very low probability of occurring because large volumes of these materials typically are not used or stored at construction sites. Construction and industrial SWPPPs and standard Port BMPs (e.g., use of drip pans, contained refueling areas, regular inspections of equipment and vehicles, and immediate repairs of leaks) would reduce the potential for materials from construction activities to enter storm drains.

The potential for encountering groundwater requiring extraction and disposal during onshore construction of the proposed Project is uncertain. If dewatering is deemed necessary, the dewatering effluent would be tested to determine specific contaminant levels in order to select the appropriate disposal options.

**Finding**

The Board hereby finds that changes or alterations have been required in, or incorporated into the project that avoid or substantially lessen the significant environmental effect identified in the FEIR. Mitigation measure **MM WR-1** would reduce the risk of discharges and spills of silt, debris, and contaminants reaching the waters of the Dominguez Channel by imposing controls and restrictions on construction activities.

**MM WR-1:** The following measures shall be implemented during the reconstruction of the Dominguez Channel Railroad Bridge:

- No construction materials, equipment, debris, or waste shall be placed or stored where it may be subject to erosion or could flow into the channel. Construction materials shall not be stored in contact with the soil.
- Floating booms shall be used to assist in containing debris discharged into Dominguez Channel, and any debris discharged shall be removed as soon as possible but no later than the end of each day.
• A silt curtain shall be utilized to assist in controlling turbidity during reconstruction of the Dominguez Channel Bridge. The Port of Los Angeles shall limit, to the greatest extent possible the suspension of benthic sediments into the water column.

• Reasonable and prudent measures shall be taken to prevent all discharge of fuel or oily waste from heavy machinery or construction equipment or power tools into the Dominguez Channel. Such measures include deployed oil booms and a silt curtain around the proposed construction zone at all times to minimize the spread of any accidental fuel spills, turbid construction-related water discharge, and debris. Other measures include training construction workers on emergency spill notification procedures, proper storage of fuels and lubricants, and provisions for on-site spill response kits.

**Rationale for Finding**

Construction activities associated with the landside features of the proposed Project have the potential to adversely affect the quality of stormwater runoff. However, the proposed Project would implement a SWPPP incorporating BMPs, such as sediment basins or traps and fabric filter fences or straw bale barriers, to control runoff of eroded soils and pollutants, and drip pans, containment, and other measures to control leaks and spills. The SWPPP would also incorporate monitoring requirements as outlined in the updated GCASP, intended to minimize potential impacts and verify BMP effectiveness. These measures, combined with the low potential for erosion, would limit the soil and contaminant loading to storm drain outlets. Therefore runoff from landside construction activities would not create pollution, contamination, a nuisance, or violate any water quality standards, and impacts on water quality would be less than significant.

Construction activities in and adjacent to the Dominguez Channel could result in discharges or spills of silt, debris, and contaminants to the water. The BMPs required by the federal, state, and local permits and implemented through the SWPPP would reduce the risk and magnitude of those discharges. The risk of discharges that would cause pollution, contamination, or a nuisance, as defined in Section 13050, would be further reduced with the implementation of **MM WR-1**. **MM WR-1**, as discussed in detail above, includes measures designed to reduce the risk of discharges of spills of silt, debris, and contaminants reaching the waters of the Dominguez Channel by imposing controls and restrictions on construction activities. The incorporation of this mitigation measure, and the specific preventative measures it includes, will mitigate the impacts to water quality to a less than significant level.

### 4.4 Cumulative Impacts

State CEQA Guidelines § 15130 requires an EIR to discuss cumulative impacts of a project when the project’s incremental effect is cumulatively considerable. Cumulative impacts include “two or more individual effects which, when considered together, are considerable or which compound or increase other environmental impacts” (State CEQA Guidelines, § 15355). When the combined cumulative impact associated with the project’s incremental effect and the effects of other projects is not significant, the EIR shall briefly indicate why the cumulative impact is not significant and is not discussed in further detail in the EIR. If the cumulative impact is significant, the EIR shall determine whether the contribution of the project to that cumulative impact is cumulatively considerable. If it is, reasonable feasible mitigation shall be required to reduce or avoid the project’s contribution to the significant cumulative impact. (CEQA Guidelines Section 15130(b)(5).)
As required by CEQA Guidelines Section 15130(b)(1)(A), the cumulative analysis for the proposed Project considered past, present and reasonably foreseeable future projects located within the general vicinity of the Project that could contribute to cumulative impacts. The discussion below identifies significant cumulative impacts to which the project’s contribution is cumulatively considerable, that can either be mitigated to a less than significant level, or that cannot be mitigated to a less than significant level and therefore represent significant unavoidable impacts. As required by CEQA Guidelines § 15130(b), the EIR’s discussion of cumulative impacts reflects the severity of the impacts and their likelihood of occurrence, but not at the level of detail provided for the effects attributable to the project alone. Criteria for which the proposed Project was found to have No Impact (see Chapter 3) are not considered in this cumulative analysis because they could not contribute to a cumulative impact. These are: AES-3, BIO-2, BIO-3, GEO-5, GEO-7, RISK-6, NOI-5, NOI-13, TRANS-6, TRANS-7, and TRANS-8. In addition, sleep awakening and speech interference were not evaluated for cumulative impacts because these were determined to be speculative (NOI-4, NOI-8, NOI-9, NOI-12, and NOI-13).

All feasible mitigation measures to reduce or avoid the cumulatively considerable contribution of the proposed Project to these significant cumulative impacts have been required, or incorporated into, the proposed Project.

4.4.1 Aesthetics and Visual Resources

Cumulative Impact AES-1: The proposal would cause a cumulatively substantial degradation of the existing visual character or quality of the site and its surroundings – Cumulatively Considerable and Unavoidable

Cumulative Impact AES-1 represents the potential for the proposed Project and related cumulative projects to result in significant cumulative visual impacts in the cumulative study area through the degradation of the existing visual character or quality of the site and its surroundings.

The visual changes that would be brought about by the proposed Project would take place in a landscape dominated by heavy and light industrial uses and transportation features. Past projects, both public and private, have largely eliminated natural features in the general area and have resulted in a viewshed dominated by man-made industrial features. The flat topography of the area limits views, but in general views are dominated by industrial and infrastructure features such as warehouses, refineries and storage tanks, stacks of containers, electrical transmission lines, and roads. Existing views in the Project area are considered to be of low sensitivity (Section 3.1.2.3 of RDEIR), the surrounding area is not considered a scenic vista for residents in the vicinity, and there are no official scenic vistas or scenic resources in the vicinity (Section 3.1.4.3 of RDEIR). The nighttime viewshed is characterized by numerous lights from industrial and transportation facilities, especially the refinery to the west of the Project site, the Praxair facility to the north, and the Union Pacific Intermodal Container Transfer Facility (ICTF) to the south.

Present and reasonably foreseeable future projects in the area consist mostly of projects that seek to improve infrastructure (several rail and highway projects), improve cargo operations, intensify industrial development, or add housing stock and commercial facilities. These projects are consistent with the existing visual character, and although some likely have localized impacts, such as nighttime glare or minor view blockages, the
overall visual character of the Project area remains, and will remain, essentially the same. Accordingly, the effect of the cumulative projects will continue to be an intensification of the view, resulting in more buildings and development, including some new open space. This change represents a significant cumulative impact.

As described under Impact AES-1, the proposed Project would not cause any adverse changes in the existing visual character or quality of the site, with the exception of the Sepulveda Boulevard railroad bridge. The proposed Project would be consistent with the character of the surrounding existing features of the landscape. The tallest elements of the proposed Project, the stacking cranes, would be largely blocked from the view of nearby non-industrial uses by existing structures and by the intensive landscaping and sound walls that would be added as project elements and mitigation. The cranes would, in any case, be generally consistent with other features of the area such as power line towers, refinery facilities, and the nearby ICTF.

Demolition of the existing Sepulveda Bridge, a historical resource, would result in a substantial change in a local view, and is a significant impact of the proposed Project. The collective effect of the past and future projects, combined with the proposed Project, would be to alter views of the general area as a result of the overall increase in the number of structures and the demolition of a historical resource. The proposed Project’s contribution to that intensification would result in a cumulatively considerable contribution to a significant cumulative impact.

Finding

The Board hereby finds that changes or alterations have been required in, or incorporated into, the proposed Project that avoid or substantially lessen the significant environmental effect identified in the FEIR. Mitigation measures MM CR-2 and MM CR-3 would ensure that historic elements of the existing railroad bridge would be maintained to the greatest extent feasible, and therefore would reduce adverse visual effects to the historical resource. However, the impact would remain significant and unavoidable due to the need to demolish and replace the bridge, as the existing bridge cannot accommodate three tracks. Specific economic, legal, social, technological, or other considerations make infeasible any additional mitigation measures.

Rationale for Finding

Changes or alterations have been required in or incorporated into the project in the form of mitigation measures MM CR-2 and MM CR-3 which would ensure that historic elements of the existing railroad bridge would be maintained to the greatest extent feasible. However, the proposed Project requires demolition and replacement of the bridge, thereby eliminating its historical materials and integrity and contributing to a significant cumulative impact. The bridge replacement is necessary because the existing bridge cannot accommodate three tracks. Therefore, the proposed Project’s contribution to the significant cumulative impact would remain cumulatively considerable.

4.4.2 Air Quality, Meteorology, and Greenhouse Gases

Cumulative Impact AQ-1: Construction would produce a cumulatively considerable increase of a criteria pollutant for which
the region is in nonattainment under a national or state ambient air quality standard – Cumulatively Considerable and Unavoidable

Cumulative Impact AQ-1 assesses the potential for proposed Project construction along with other cumulative projects to produce a cumulatively significant increase in criteria pollutant emissions for which the project region is in nonattainment under a national or state ambient air quality standard or for which the SCAQMD has set a daily emission threshold.

As described in Section 3.2.2.2 of the RDEIR, air quality within the SCAB has generally improved since the inception of air pollutant monitoring in 1976. This improvement is mainly due to lower-polluting on-road motor vehicles, more stringent regulation of industrial sources, and the implementation of emission reduction strategies by the SCAQMD. This trend towards cleaner air has occurred in spite of continued population growth.

In the time period between 2013 and 2015, several large construction projects will occur at the two ports and in the surrounding areas that will overlap in time, and a number of smaller commercial and residential projects are or will be under construction as well. The construction impacts of the related projects would be cumulatively significant if their combined emissions would exceed the SCAQMD daily emission thresholds for construction. Because this would certainly be the case for all analyzed criteria pollutants and precursors (VOCs, CO, NOX, SOX, PM10, and PM2.5), the proposed Project, including the related projects, would result in a significant cumulative air quality impact.

Emissions from proposed Project construction would exceed SCAQMD significance criteria for VOCs, CO, NOX, PM10, and PM2.5; accordingly, there would be increases in criteria pollutants for which the region is in non-attainment (PM10 and PM2.5). These emissions, when combined with emissions from the other concurrent construction projects, would make a cumulatively considerable contribution to a significant cumulative impact for PM10 and PM2.5 emissions. Mitigation measures MM AQ-1 through MM AQ-6, which would apply controls to construction equipment and practices, would be implemented during construction of the proposed Project. After mitigation, construction emissions would remain above SCAQMD thresholds for at least one of the construction years (Tables 3.2-15 and 3.2-16 of RDEIR).

Finding

The Board hereby finds that changes or alterations have been required in, or incorporated into, the project that avoid or substantially lessen the significant environmental effect identified in the FEIR. Mitigation measures MM AQ-1 through MM AQ-6 would help reduce construction emissions, however would not reduce impacts below significance. Specific economic, legal, social, technological, or other considerations make infeasible any additional mitigation measures.

Rationale for Finding

Changes or alterations have been required in or incorporated into the project in the form of mitigation measures mitigation measures MM AQ-1 through MM AQ-6 which would help reduce construction emissions. However, the proposed Project’s contribution to the significant cumulative impact would remain cumulatively considerable.
Cumulative Impact AQ-2: The construction of the proposed Project would result in offsite ambient air pollutant concentrations that exceed a SCAQMD threshold of significance – Cumulatively Considerable and Unavoidable

Cumulative Impact AQ-2 assesses the potential for proposed Project construction along with other cumulative projects to produce ambient pollutant concentrations that exceed an ambient air quality standard or substantially contribute to an existing or projected air quality standard violation.

The past, present, and reasonably foreseeable future projects would result in significant cumulative impacts if their combined effects, during construction, would cause ambient pollutant concentrations to exceed the SCAQMD thresholds. Although there is no way to be certain if a cumulative exceedance of the thresholds would happen for any pollutant without performing dispersion modeling of the other projects, previous experience with large projects in the SCAB indicates that cumulative air quality impacts would be likely to exceed the thresholds for NOx, could exceed the thresholds for PM10 and PM2.5, and would be unlikely to exceed the thresholds for CO. Consequently, construction of the past, present, and reasonably foreseeable future projects, including the proposed Project, would result in significant cumulative air quality impacts related to exceedances of the significance thresholds for NOx, PM10, and PM2.5.

As described under Impact AQ-2 of the RDEIR, construction of the proposed Project would exceed the SCAQMD thresholds for 1-hour and annual NO2, 24-hour and annual PM10, and 24-hour PM2.5. These exceedances would constitute a cumulatively considerable contribution to a cumulative air quality impact.

Finding

The Board hereby finds that changes or alterations have been required in, or incorporated into, the project that avoid or substantially lessen the significant environmental effect identified in the FEIR. Mitigation measures MM AQ-1 through MM AQ-3 have been applied to the Project to reduce construction emissions. With mitigation, impacts from proposed Project construction would exceed 1 hour and annual NO2 and 24-hour and annual PM10 threshold and would therefore contribute to a cumulatively considerable and unavoidable significant impact when combined with other related projects. Specific economic, legal, social, technological, or other considerations make infeasible any additional mitigation measures.

Rationale for Finding

Changes or alterations have been required in or incorporated into the project in the form of mitigation measures MM AQ-1 through MM AQ-3, which would apply controls to construction equipment and practices. After mitigation, the 1-hour and annual NO2 and 24-hour and annual PM10 increments would still exceed the SCAQMD ambient thresholds (Tables 3.2-21 and 3.2-22 of the RDEIR). Therefore, the proposed Project after mitigation would make a cumulatively considerable and unavoidable contribution to a significant cumulative impact.

Cumulative Impact AQ-3: The operation of the proposed Project would not result in operational emissions that exceeding 10 tons per
year of VOCs and SCAQMD thresholds of significance –Cumulatively Considerable and Unavoidable

Cumulative Impact AQ-3 assesses the potential for proposed Project operation along with other cumulative projects to produce a cumulatively significant increase in criteria pollutant emissions for which the project region is in nonattainment under a national or state ambient air quality standard or for which the SCAQMD has set a daily emission threshold.

The past, present, and reasonably foreseeable future projects would have a significant cumulative impact if their combined operational emissions would exceed the SCAQMD daily emission thresholds for operations. Because this almost certainly would be the case for all analyzed criteria pollutants (except, as described in Section 3.2.4.3 of the RDEIR, for the proposed Project), the past, present, and reasonably foreseeable future projects would result in a significant cumulative air quality impact.

Finding

As described in Section 3.2.4.3 of the RDEIR, peak daily operational emissions from the proposed Project would decrease relative to baseline emissions for VOCs, NO\textsubscript{X}, SO\textsubscript{X}, PM\textsubscript{10}, and PM\textsubscript{2.5} during all project analysis years. Therefore, emissions from operation of the proposed Project would not make a cumulatively considerable contribution to an existing significant cumulative impact for VOCs, NO\textsubscript{X}, SO\textsubscript{X}, PM\textsubscript{10}, and PM\textsubscript{2.5} emissions. CO emissions from the Project would increase relative to baseline emissions, although these emissions are less than the CEQA significance thresholds. Therefore emissions from operation of the proposed Project would make a cumulatively considerable contribution to an existing significant cumulative impact for CO when combined with other related projects.

The Board hereby finds that changes or alterations have been required in, or incorporated into, the project that avoid or substantially lessen the significant environmental effect identified in the FEIR. All feasible mitigation measures MM AQ-7 and MM AQ-8 for operational emissions associated with the proposed Project have been applied. Specific economic, legal, social, technological, or other considerations make infeasible any additional mitigation measures.

Rationale for Finding

All feasible mitigation measures for operational emissions associated with the proposed Project have been applied as described in Section 3.2 of the RDEIR. No reasonable mitigation measures could be considered for operational emissions associated with displaced businesses as it is not known where these businesses would relocate in the South Coast Air Basin and what discretionary actions would be required under CEQA for the relocation of the displaced businesses.

Cumulative Impact AQ-4: The operation of the proposed Project would produce emissions that, with related projects, result in offsite ambient air pollutant concentrations that would exceed a SCAQMD threshold of significance – Cumulatively Considerable and Unavoidable

Cumulative Impact AQ-4 assesses the potential for proposed Project operation along with other cumulative projects to produce ambient concentrations that exceed an ambient
air quality standard or substantially contribute to an existing or projected air quality standard violation.

The past, present, and reasonably foreseeable future projects would result in significant cumulative impacts if their combined ambient concentration levels during operations would exceed the SCAQMD ambient concentration thresholds for operations. Although there is no way to be certain if a cumulative exceedance of the thresholds would happen for any pollutant without performing dispersion modeling of the other projects, previous experience indicates that cumulative air quality impacts would be likely to exceed the thresholds for NO\textsubscript{X}, could exceed the thresholds for PM\textsubscript{10} and PM\textsubscript{2.5}, and would be unlikely to exceed the thresholds for CO. Consequently, operation of the past, present, and reasonably foreseeable future projects, including the proposed Project, would result in a significant cumulative air quality impact related to exceedances of the significance thresholds for NO\textsubscript{X}, PM\textsubscript{10}, and PM\textsubscript{2.5}.

As described under Impact AQ-4, operation of the proposed Project would cause exceedances of the SCAQMD thresholds for 1-hour and annual NO\textsubscript{2}, 24-hour and annual PM\textsubscript{10}, and 24-hour PM\textsubscript{2.5}. It would also cause exceedances of the NAAQS for 1-hour NO\textsubscript{2}. Therefore, the Project would result in a cumulatively considerable contribution to a significant cumulative impact.

**Finding**

The Board hereby finds that changes or alterations have been required in, or incorporated into, the project that avoid or substantially lessen the significant environmental effect identified in the FEIR. Mitigation measure MM AQ-7 would be applied to the proposed Project to help reduce operational emissions. However, NO\textsubscript{2}, PM\textsubscript{10}, and PM\textsubscript{2.5} concentrations would still exceed ambient thresholds under CEQA. Specific economic, legal, social, technological, or other considerations make infeasible any additional mitigation measures.

**Rationale for Finding**

Changes or alterations have been required in or incorporated into the project in the form of mitigation measure MM AQ-7 (on-site sweeping) which would be implemented during operation of the proposed Project. Even with this mitigation, 1-hour and annual NO\textsubscript{2}, 24-hour and annual PM\textsubscript{10}, and 24-hour PM\textsubscript{2.5} would remain above the SCAQMD thresholds (Tables 3.2-30 and 3.2-31 of the RDEIR). Therefore, the proposed Project after mitigation would make a cumulatively considerable and unavoidable contribution to a significant cumulative impact under CEQA.

**Cumulative Impact AQ-7:** The Project operation would contribute to exposing receptors to significant levels of toxic air contaminants – Cumulatively Considerable and Unavoidable

**Cumulative Impact AQ-7** assesses the potential of the proposed Project construction and operation along with other cumulative projects to produce TACs that exceed acceptable public health criteria.

The main sources of TACs from proposed Project operations are DPM emissions (considered by CARB and OEHHA as representative of diesel exhaust) from SCIG offsite and onsite trucks, locomotives, and CHE and onsite trucks associated with the businesses on the alternate locations. As described in Table 3.2-33 of the RDEIR,
emissions of TACs from operation of the proposed Project would increase cancer risks from baseline levels by between 2 and 27 in a million, depending on the receptor (residential, occupational, sensitive, student, and recreational) and the receptor location. The significance threshold is an increase of 10 in a million, meaning that the proposed Project’s impacts would be significant. Emissions of TACs would increase chronic and acute noncancer effects, modeled to have a chronic HI between 0.16 and 0.69 and an acute HI of 0.27 and 0.79, compared to baseline levels. These increases would all be well below the 1.0 hazard index significance criterion at all receptors near the Project site.

Finding

The Board hereby finds that changes or alterations have been required in, or incorporated into, the project that avoid or substantially lessen the significant environmental effect identified in the FEIR. Mitigation measures MM AQ-1 and MM AQ-2 applied in Impact AQ-1 would reduce the impacts from the Project by reducing emissions from construction equipment operating at the Port. In addition to the construction mitigation measures, MM AQ-8 (use of low-emission drayage trucks; see Section 3.2.4.3), MM AQ-9 (periodic review of new technologies and regulations), and MM AQ-10 (substitution of new technologies) would be implemented during operation of the proposed Project. With these mitigation measures, cancer risks from operation TACs emissions would be below the significance threshold. Although all feasible mitigation measures are applied as described above, the proposed Project after mitigation would make a cumulatively considerable contribution to a significant cumulative impact. Specific economic, legal, social, technological, or other considerations make infeasible any additional mitigation measures.

Rationale for Finding

The Ports have approved port-wide air pollution control measures through the CAAP. Implementation of these measures will reduce the health risk impacts from the proposed Project and past, present, and reasonably foreseeable future projects at the Ports. Currently adopted regulations and future rules proposed by CARB and USEPA will further reduce air emissions and associated cumulative health impacts from area industrial facilities heavy-duty trucks traveling along local streets, and past, present, and reasonably foreseeable future projects not subject to the CAAP. However, because future proposed measures have not yet implemented CAAP measures, mitigation imposed through CEQA, or upcoming rules and regulations, they have not yet contributed to reductions in health risk. Therefore, it is unknown at this time how and when these future related projects would reduce cumulative health risk impacts within the Port area, and the cancer risk due to TAC emissions within the region must be considered a significant cumulative impact.

The San Pedro Bay Ports Baywide Health Risk Assessment (BWHRA) projects reductions in residential cancer health risk from port-related DPM emissions as a result of the implementation of the CAAP and the various DPM emission reduction measures within the CAAP. The proposed Project incorporates a number of environmental features that are consistent with the CAAP and BWHRA goals, including HDV-1 and HDV-2, CHE-1, and RL-2. Given these environmental features and the projected reductions in cancer and noncancer health risk, TAC emissions from the proposed Project would still result in a cumulatively considerable contribution to a significant cumulative health impact. Furthermore, it is expected that the Project would incorporate, as conditions of approval at the discretion of the Board of Harbor Commissioners, a zero-emission
technology demonstration program (PC AQ-11) and CAAP measure RL-3 (PC AQ-12), in addition to the mitigation measures discussed above. These discretionary project conditions would provide additional public health benefits beyond what was analyzed in the EIR.

4.4.3 Biological Resources

Cumulative Impact BIO-1: The construction and operation of the Project would potentially result in the loss of individuals of, or have a substantial adverse effect, either directly or through habitat modifications, on federally listed critical habitat or species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the CDFG or USFWS – Less than Cumulatively Considerable after Mitigation

Cumulative Impact BIO-1 assesses the potential for the proposed Project and related projects to result in significant cumulative impacts in the cumulative study area through the loss of individuals of, or have a substantial adverse effect, either directly or through habitat modifications, on federally listed critical habitat or species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the CDFG or USFWS.

Native birds are protected during their nesting season under the Migratory Bird Treaty Act (MBTA). Three sensitive bird species are known to occur on or near the Project site, and three sensitive bat species have a low potential to occur. The past, present, and reasonably foreseeable future projects, including the proposed Project, have the potential to have adverse effects on these sensitive species. Construction of many of the port projects, including the proposed Project, would have temporary, minor impacts on foraging by the three sensitive bird species, which are marine birds; on nesting native birds; and on roosting and foraging by some or all of the three bat species. However, environmental analyses, detailed in Section 4.2.3.2 of the RDEIR, have concluded that the impacts would be temporary and less than significant. Construction of the inland projects would not affect the three sensitive bird species, but could disturb or remove nesting habitat for native birds and roosting and foraging habitat for bats by removal of trees and modification of bridges. These adverse effects on sensitive species constitute significant cumulative impacts.

Finding

The Board hereby finds that changes or alterations have been required in, or incorporated into, the project that avoid or substantially lessen the significant environmental effect identified in the FEIR. Mitigation measure MM BIO-1a would be implemented to minimize adverse effects of Project construction on native birds protected by the MBTA and to minimize the potential for loss of bat roosting habitat.

Rationale for Finding

Changes or alterations have been required in or incorporated into the project in the form of mitigation measure MM BIO-1a. This mitigation would reduce impacts of the proposed Project to less than significant. Given the small likelihood of substantial
impacts attributable to the proposed Project, the Project’s contribution to cumulative impacts on sensitive species is not cumulatively considerable after mitigation.

### 4.4.4 Cultural Resources

**Cumulative Impact CR-1:** The Project would substantially contribute to disturbance, damage, or degradation of unknown archaeological or ethnographic resources, and thus cause a substantial adverse change in the significance of such resources – Less than Cumulatively Considerable after Mitigation

*Cumulative Impact CR-1* represents the potential of the proposed Project along with other cumulative projects to substantially contribute to disturbance, damage, or degradation of unknown archaeological or ethnographic resources, and thus cause a substantial adverse change in the significance of such resources in the cumulative study area.

Archaeologists estimate that past and present projects within urban areas including the project vicinity have destroyed over 80 percent of all prehistoric sites without proper assessment and systematic collection of information beforehand. Such projects have eliminated our ability to study sites that may have been likely to yield information important in prehistory.

Construction activities (i.e., excavation, dredging, and land filling) associated with most present and future Port projects would be in areas of historical estuary habitats and recent landfills, and therefore would not affect prehistoric or historical archaeological or ethnographic resources. Although much of the uplands in the Project area, including the site of the proposed Project, have been previously disturbed, there is the potential for many of the related projects, including some Port projects on the periphery of the Harbor District to disturb unknown, intact subsurface prehistoric or historical archaeological resources. The likelihood that the related projects would encounter archaeological and ethnographic resources is remote, as most of the area has already been developed, but because prehistoric sites are non-renewable resources, the cumulative impacts of these actions are considered significant.

**Finding**

As documented in Impact CR-1, there are no recorded listed, eligible, or otherwise unique or important archaeological or ethnographic resources within the proposed Project site. However, other projects and excavations in the vicinity of the proposed Project have uncovered archaeological artifacts and intact prehistoric human burials. Accordingly, the Project area has the potential to contain unknown archaeological or ethnographic resources, including human remains, and the potential for disturbing, damaging, or degrading unknown prehistoric or historic remains or ethnographic resources is considered a cumulatively considerable contribution to a significant cumulative impact on archaeological or ethnographic resources.

The Board hereby finds that changes or alterations have been required in, or incorporated into, the project that avoid or substantially lessen the significant environmental effect identified in the FEIR. Mitigation measure **MM CR-1** provides for monitoring and requires that work shall be immediately stopped and relocated from the area in the...
unlikely event that potentially significant, intact archaeological or ethnographic resources are encountered during construction.
Rationale for Finding

As discussed above, construction activities associated with the proposed Project, as well as present and reasonably foreseeable future projects, would be in areas of historical estuary habitats and recent landfills. Moreover, while much of the project area is previously disturbed and the likelihood that related projects would encounter archaeological and ethnographic resources is remote, there is a potential for related projects to disturb unknown, intact subsurface prehistoric or historical archaeological resources.

Nevertheless, MM CR-1, explained in more detail above, is included to ensure that cumulative impacts to archaeological or ethnographic resources are not cumulatively considerable. MM CR-1 provides for monitoring and requires that work shall be immediately stopped and relocated if potentially significant, intact archaeological or ethnographic resources are encountered.

Changes or alterations have been required in or incorporated into the project in the form of mitigation. With implementation of MM CR-1, therefore, the proposed Project would not constitute a cumulatively considerable contribution to a significant cumulative impact on archaeological and ethnographic resources.

Cumulative Impact CR-2: The Project would have cumulatively substantial adverse effects on the significance of historic resources—Cumulatively Considerable and Unavoidable

Cumulative Impact CR-2 represents the potential for the proposed Project and related projects to result in significant cumulative impacts in the cumulative study area through substantial adverse effects on the significance of historic resources.

Redevelopment of the intensively developed Wilmington – Long Beach region in the course of past, present, and reasonably foreseeable future projects, including the proposed Project, have required and are anticipated to require the demolition of structures over 45 years of age. While each project mitigates the loss of historic structures through such means as archival documentation, interpretive displays, and salvage or adaptive re-use of key elements, the net effect is a continued decrease in the number and variety of older structures in the region. The effects of the related projects on historic resources are a significant cumulative impact.

The proposed Project would result in a cumulatively considerable contribution to a significant cumulative impact on a historical resource because it would materially alter, in an adverse manner, the physical characteristics of the Sepulveda Boulevard railroad bridge that convey its historical significance and justify its eligibility for inclusion in the CRHR.

Finding

The Board hereby finds that changes or alterations have been required in, or incorporated into, the project that avoid or substantially lessen the significant environmental effect identified in the FEIR. Mitigation measure MM CR-2 and MM CR-3 would be implemented to reduce the impacts to the bridge. Through these measures, archival documentation would be conducted and a plan for salvaging noteworthy elements, if possible, would be prepared. Specific economic, legal, social, technological, or other considerations make infeasible any additional mitigation measures.
Rationale for Finding

The demolition and replacement of the Sepulveda Boulevard Bridge is necessary because the existing bridge cannot accommodate three tracks. Similarly, past, present, and reasonably foreseeable future projects in the area are anticipated to require the demolition of historic structures. While each project mitigates the loss of historic structures, together with the demolition of the Sepulveda Boulevard Bridge, the effect is a continued decrease in the number and variety of older historic structures in the region.

MM CR-2 and MM CR-3, as discussed above, would be implemented to reduce impacts to the bridge. These mitigation measures, which focus on alternative means of preservation and historical documentation, represent the only feasible mitigation measures. However, even with the implementation of MM CR-1 and MM CR-3, because demolition and replacement is necessary, the Project will have a significant cumulative impact that would remain considerable and unavoidable.

Changes or alterations have been required in or incorporated into the project in the form of mitigation measures MM CR-2 and MM CR-3. Despite these measures, the bridge would be demolished, and the proposed Project’s contribution to a significant cumulative impact would remain considerable and unavoidable. No further mitigation is available to reduce this impact to less than significant.

Cumulative Impact CR-3: The Project would contribute substantially to the disturbance, destruction, or elimination of access to unknown unique paleontological resources – Less than Cumulatively Considerable after Mitigation

Cumulative Impact CR-3 represents the potential for the proposed Project and related cumulative projects to results in significant cumulative impacts through contributing substantially to the disturbance, destruction, or elimination of access to unknown unique paleontological resources.

Redevelopment of the intensively developed Wilmington – Long Beach region in the course of past, present, and future Port projects have and are anticipated to require excavation. When excavation occurs in native formations (as opposed to previously disturbed or created land) there is the possibility that intact paleontological resources will be encountered; several fossils of paleontological value have been discovered in the general area (Section 3.4.2 of the DEIR). Most of the related past, present, and reasonably foreseeable future projects, including the proposed Project, have or would take place in upland areas where native formations may be encountered. As is the case with archeological and ethnographic resources, projects in the Ports are unlikely to encounter paleontological resources because of the disturbed or created nature of the lands. Related projects in upland areas have a higher potential to encounter paleontological resources because they have a higher potential to take place on previously undisturbed land. The controls placed on construction projects in upland areas reduce, but do not eliminate, the possibility that paleontological resources may be destroyed. Accordingly, the proposed Project when combined with related projects would contribute to a significant cumulative impact.

Finding

The Board hereby finds that changes or alterations have been required in, or incorporated into, the project that avoid or substantially lessen the significant environmental effect
identified in the FEIR. Mitigation measure MM CR-4, monitoring and recovery, would be implemented to reduce potential impacts in the event that paleontological resources are encountered during construction.

Rationale for Finding

As discussed above, redevelopment in the project vicinity, including past, present, and reasonably foreseeable projects, is anticipated to require excavation. Excavation has the potential to encounter intact paleontological resources. Nevertheless, because projects in the area will occur on disturbed or created lands through imported fill, such projects are unlikely to encounter paleontological resources.

The proposed Project would result in little or no ground disturbance within areas of high paleontological sensitivity; rather, excavations would occur in areas extensively and previously disturbed. Nevertheless, Project construction could expose subsurface paleontological resources, and if that occurred without appropriate professional oversight, systematic recovery would be impossible and the ability to preserve specimens for future study would be lost. MM CR-4, which mandates paleontological monitoring of ground disturbing activities by a qualified paleontologist, and provides specific measures should paleontological resources be encountered, would ensure that the Project would not have a cumulatively considerable contribution to a significant cumulative impact.

Changes or alterations have been required in or incorporated into the project in the form of mitigation measure MM CR-4. With mitigation, the Project would not constitute a considerable contribution to a significant cumulative impact.

4.4.5 Greenhouse Gas Emissions and Climate Change

Cumulative Impact GHG-1: The proposed Project would result in a cumulatively substantial increase in construction-related and operation-related GHG emissions – Cumulatively Considerable and Unavoidable

Cumulative Impact GHG-1 represents the potential for the proposed Project and related cumulative projects to result in significant cumulative impacts through substantial increase in construction-related and operation-related GHG emissions.

Past, present, and reasonably foreseeable future projects in the area have generated, and will continue to generate, GHGs from the combustion of fossil fuels and the use of coatings, solvents, refrigerants, and other products. Current and future projects will incorporate a variety of GHG reduction measures in response to federal, state, and local mandates and initiatives (CARB, 2011b), and these measures are expected to reduce GHG emissions from future projects. However, because of the long-lived nature of GHGs in the atmosphere, and the global nature of GHG emissions impacts, no specific quantitative level of GHG emissions from related projects in the region, or state-wide has been identified below which no impacts would occur. Therefore these emissions are considered to represent a significant cumulative impact.
Finding

The proposed Project would generate GHGs during both construction and operation. Since the POLA has established a threshold of zero as its significance criterion for GHG-1 for this project only, those emissions represent a considerable contribution to an existing significant cumulative impact. A number of project features would reduce GHG emissions, including the use of electric RMG cranes, idle reduction devices for locomotives, and a site administration building that is LEED certified.

The Board hereby finds that changes or alterations have been required in, or incorporated into, the project that avoid or substantially lessen the significant environmental effect identified in the FEIR. Mitigation measures MM GHG-1 through MM GHG-10 would be implemented for the proposed Project that are expected to reduce GHG emissions through increased energy efficiency, recycling, solar energy use, tree planting, water conservation, and carbon offsets. Specific economic, legal, social, technological, or other considerations make infeasible any additional mitigation measures.

Rationale for Finding

Changes or alterations have been required in or incorporated into the project in the form of mitigation measures MM GHG-1 through MM GHG-10. However, since the reductions from those measures cannot be quantified, the proposed Project would make a cumulatively considerable contribution to a significant cumulative impact.

4.4.6 Land Use

Cumulative Impact LU-4: Would the proposed Project contribute to cumulatively significant secondary impacts to surrounding land uses – Cumulatively Considerable and Unavoidable

Cumulative Impact LU-4 represents the potential for the proposed Project and related cumulative projects to result in significant cumulative impacts through contributing secondary impacts to surrounding land uses.

Secondary effects are defined as “effects which are caused by the project and are later in time or farther removed in distance… [and] may include growth-inducing effects and other effects related to induced changes in the pattern of land use, population density, or growth rate, and related effects on air and water and other natural systems, including ecosystems” (CEQA Guidelines, §15358). Impacts on air and water quality, and biological resources are evaluated in sections 3.2, 3.12, and 3.3 of the DEIR/RDEIR. Additional secondary effects such as the potential to cause economic impacts or blighted conditions are addressed in Chapter 7, Socioeconomics and Environmental Quality of the RDEIR. Secondary impacts refer here to the possible nexus between activities at the proposed Project (resulting, for example, in air emissions, noise, traffic congestion) and land use changes in communities adjacent to the Project site.

The general area of the proposed Project has a variety of land use and zoning designations ranging from heavy industrial to residential. Related projects would be consistent with those uses, and would be constructed on land appropriately zoned. Previous projects have resulted in present conflicts with public policy concerning facility siting. For example, several schools in west Long Beach are within one-quarter mile of a major freeway (the TI Freeway) and a major railyard (the ICTF). The related industrial projects could constrain future siting of sensitive uses in the area.
The area of the proposed Project has been heavily industrial, dominated by refineries, the Ports, and heavy transportation activities, for several decades. Those industries have caused secondary impacts relating to air quality, public health, traffic, and noise. The related projects in the cumulative study area would likely not induce appreciable immigration or emigration in the adjacent communities, since they do not represent major new employers. However, the related projects, particularly the industrial projects such as the Port projects can be expected to have secondary impacts related to air quality, traffic, and noise. Although most of those impacts would be reduced by mitigation measures and project controls, residual impacts would likely remain. As a consequence, past, present, and reasonably foreseeable future projects would result in significant cumulative secondary impacts to surrounding land uses.

Finding

The Board hereby finds that changes or alterations have been required in, or incorporated into, the project that avoid or substantially lessen the significant environmental effect identified in the FEIR. Mitigation measures for air quality and noise impacts have been imposed (MM AQ-1 through MM AQ-10, MM NOI-1 through MM NOI-3), but those mitigation measures are not expected to reduce all of the identified impacts to less than significant. Specific economic, legal, social, technological, or other considerations make infeasible any additional mitigation measures.

Rationale for Finding

As discussed above, secondary impacts refer here to the possible nexus between activities at the proposed Project (resulting, for example, in air emissions, noise, traffic congestion) and land use changes in communities adjacent to the Project site. The cumulative projects, particularly the industrial projects such as the Port projects can be expected to have secondary impacts related to air quality, traffic, and noise. Although most of those impacts would be reduced by mitigation measures and project controls, residual impacts would likely remain.

As stated under Impact LU-4, the proposed Project would not cause changes in patterns of land use in adjacent communities or cause immigration or emigration in response to changing job opportunities. Future siting of sensitive uses in the portion of West Long Beach adjacent to the Terminal Island Freeway would be precluded by the presence of the proposed Project. However, because other industrial uses in the area (including the existing ICTF) and the presence of the Terminal Island Freeway would also discourage such siting, the proposed Project would not contribute to significant cumulative land use impacts would not be cumulatively considerable.

The proposed Project’s impacts related to air quality and noise would result in secondary impacts on nearby sensitive uses and would contribute to a significant cumulative secondary impact on land use related to air quality and noise. As discussed above, numerous mitigation measures were incorporated to minimize impacts to air quality and noise. As discussed in SCIG RDEIR Section 3.2, Air Quality, various mitigation measures are incorporated to mitigate impacts to air quality. MM AQ-1, for instance, imposes requirements for modernization of fleet construction equipment. MM AQ-7 requires on-site sweeping at SCIG. Similarly, MM AQ-9 and MM AQ-10 mitigate impacts to air quality by requiring the review and consideration of new technology, should the effectiveness of the technology be proven.
A number of the mitigation measures incorporated in Section 3.9, Noise, are also relevant to this impact. Under MM NOI-1, for example, BNSF must construct a permanent soundwall on the easterly right-of-way of the Terminal Island Freeway. MM NOI-2 includes a large number of noise control measures that must be implemented during construction of the Project. However, some of the impacts from those resources areas would remain significant, and, therefore, would contribute to cumulatively considerable secondary impacts.

Changes or alterations have been required in or incorporated into the project in the form of mitigation measures. Because the proposed Project would continue to have significant air quality and noise impacts, it would also have a cumulatively considerable contribution to a residual cumulative land use impact.

### 4.4.7 Noise

**Cumulative Impact NOI-6: Construction and operation of the proposed Project would contribute to a cumulative increase in ambient noise levels by three dBA or more, or to an exceedance of maximum noise levels allowed by the Long Beach Municipal Code – Cumulatively Considerable and Unavoidable**

Cumulative Impact NOI-6 represents the potential of construction and operation activities of the proposed Project along with other cumulative projects to cause a substantial increase in ambient noise levels at sensitive receivers within the cumulative geographic scope.

There are ten noise-sensitive receptors in the City of Long Beach that are in the vicinity of the proposed Project. Operation of the proposed Project and related projects could adversely affect these receptors.

Of the past, present, and reasonably foreseeable future projects in the cumulative study area, only the ICTF Modernization and Expansion, the Schuyler Heim Bridge Replacement/State Route (SR) 47 Terminal Island Expressway, and the Admiral Kidd Park Expansion projects are close enough to the sensitive receptors to have potential noise impacts. Construction and operation of those projects would likely increase ambient noise levels by more than 5 dB during the day (and 3 dB at night if nighttime construction were to occur) at some of those receptors, resulting in significant cumulative impact. Operation of the related projects would contribute noise from traffic, trains, and recreational activities. In particular, ICTF operations would likely cause significant noise impacts at some receptors. The other two related projects would be perceived as distance background noise, and would likely not have significant impacts on the sensitive receptors considered in this analysis. Accordingly, operation of the related projects would result in a significant cumulative impact.

As described under Impact NOI-6, Project-related increases in construction noise at sensitive receivers R1 through R8 and R30 would be more than 5 dB over existing ambient levels. The increase in construction noise would be temporary and during periods of reduced construction activity, noise levels would be lower. However, because the increase would exceed the threshold, the proposed Project would have a significant impact associated with construction noise.

Some roadways in Long Beach with noise-sensitive receptors would experience Project-related increases in operational noise exceeding the 3 dBA threshold, and operational
noise levels would exceed existing measured ambient noise levels by 3 dBA or greater at
sensitive receptors R1 (2789 Webster) and R5 (Cabrillo High School). Accordingly, the
proposed Project would make a cumulatively considerable contribution to a significant
cumulative noise impact.

**Finding**

The Board hereby finds that changes or alterations have been required in, or incorporated
into, the project that avoid or substantially lessen the significant environmental effect
identified in the FEIR. Three mitigation measures would address the significant impacts
from construction and operational-phase noise at nearby noise sensitive receptors. MM
NOI-1, which consists of construction of a 12-foot-high sound wall, and MM NOI-2,
implementation of noise suppression techniques during construction, would be required
for mitigation of cumulative construction impacts. MM NOI-3, construction of a 24-ft-
high sound wall north of Sepulveda/Willow Boulevard, would mitigate operational noise
from train horns on the San Pedro Branch rail line. After applying mitigation measures
MM NOI-1 through MM NOI-3, impacts would still be significant because nighttime
operational noise might not be fully mitigated. Specific economic, legal, social,
technological, or other considerations make infeasible any additional mitigation
measures.

**Rationale for Finding**

Changes or alterations have been required in or incorporated into the project in the form
of mitigation measures. After applying mitigation measures MM NOI-1 through MM
NOI-3, impacts would still be significant because nighttime operational noise might not
be fully mitigated. No further feasible mitigation was identified. Accordingly, the
residual cumulative impact would be significant and unavoidable.

**4.4.8 Utilities and Public Services**

**Cumulative Impact PS-6: The proposed Project would contribute to
cumulatively considerable impacts on existing solid waste handling
and disposal facilities – Cumulatively Considerable and Unavoidable**

**Cumulative Impact PS-6** represents the potential of the proposed Project along with
other cumulative projects to contribute to cumulatively considerable impacts on existing
solid waste handling and disposal facilities.

Existing commercial and industrial facilities in the Project area generate non-hazardous
and municipal solid waste disposed of either at Bradley Landfill or Sunshine Canyon,
depending on daily capacities and hours of operation. Bradley Landfill had 12 percent
available capacity as of 2002 and Sunshine Canyon landfill had a remaining lifespan of
approximately 7.2 years as of 2004.

Past, present, and reasonably foreseeable future projects in the cumulative study area all
generate, or will generate, solid waste that must be disposed of in landfills for the
foreseeable future. Given that no additional landfill capacity has been brought on line and
Los Angeles has not achieved its zero-waste solution, continued solid waste generation
by the related projects represents a significant cumulative impact.

During operation the proposed Project would generate 1.340 tons/day of non-hazardous
waste that would require transportation to the Sunshine County Landfill. Once Sunshine
Canyon is closed, this amount of solid waste would represent a significant impact to landfill capacity. If additional adequate landfill capacity becomes available and/or if the achievement of Zero-Waste solutions in the City occurs, then the solid waste generated by the Project likely would not represent a significant impact to landfill capacity. However, this analysis assumes those events will not occur and that the solid waste generated by the Project beyond 2030 would represent a cumulatively considerable contribution to a significant cumulative solid waste impact.

Finding

The Board hereby finds that changes or alterations have been required in, or incorporated into, the project that avoid or substantially lessen the significant environmental effect identified in the FEIR. Although mitigation measures MM PS-1 through MM PS-3 would help reduce the amount of solid waste generated, the residual impact would still result in a cumulatively considerable contribution to a significant cumulative impact. Specific economic, legal, social, technological, or other considerations make infeasible any additional mitigation measures.

Rationale for Finding

Mitigation measures MM PS-1 through MM PS-3, respectively provide that: a) demolition and/or excess construction materials shall be separated onsite for reuse/recycling or proper disposal and separate bins for recycling of construction materials shall be provided onsite, b) materials with recycled content shall be used in project construction and chippers on site shall be used to further reduce excess wood for landscaping cover, and c) the proposed Project complies with policies and standards set forth in the City’s Solid Waste Integrated Resources Plan (SWIRP) following 2025, which has the goal of zero waste. Although mitigation measures MM PS-1 through MM PS-3 would help reduce the amount of solid waste generated, the residual impact would still result in a cumulatively considerable contribution to a significant cumulative impact. Changes or alterations have been required in or incorporated into the project in the form of mitigation measures. Nevertheless, given the uncertainty regarding the future of landfill capacity and waste reduction in the region, the proposed project’s residual impact would result in a cumulatively considerable contribution to a significant cumulative impact.

4.5 Mitigation Measures Suggested as Part of Public Comment on the DEIR and RDEIR

Numerous comment letters were received on both the DEIR and the RDEIR suggesting the Port adopt additional mitigation measures. The suggested mitigation measures and the reasons supporting why the recommended measure was accepted or rejected are summarized below; additional detail can be found in the comments and responses to comments in the FEIR Chapter 2.

Displaced Businesses

One comment characterized the displacement of businesses as a “special impact” and suggested that the LAHD provide relocation assistance as a mitigation measure. As FEIR Chapter 2 (Master Response 8, Displaced Businesses) explains, the displacements that would occur under the Project would not constitute an impact under CEQA, and therefore mitigation is not needed. Furthermore, under CEQA, there is no obligation to provide
relocation assistance or to mitigate economic issues when there is no physical effect on
the environment. Accordingly, the commenter’s suggestion was not adopted as a
mitigation measure in the EIR.

Construction Controls
Several comments suggested mitigation measures addressing impacts from Project
construction, specifically:

1. Impose a Traffic Management Plan
   As discussed in Section 3.10.3.5.1 of the RDEIR, traffic impacts during construction
   would be less than significant. Accordingly, imposing a traffic management plan (TMP)
   as mitigation would be inappropriate. Nevertheless, the TMP has been incorporated into
   the MMRP, in a table that is separate and distinct from CEQA mitigation measures, for
   tracking and reporting purposes in order to ensure compliance with this project
   requirement during construction.

2. Install MERV 10 filters on neighborhood houses and schools
   A comment requested that isopleths of PM concentrations resulting from Project
   construction activities be used to define a “zone of impact” and that sensitive
   receptors (e.g., schools, health care facilities, and residences) within that zone be
   provided with MERV 10 filters to mitigate those impacts. The FEIR’s Chapter 2
   (responses to comments) explained why isopleths are not required to evaluate air
   quality impacts and why installation of filters for all air intakes of buildings at
   sensitive receptors is not proportional in nature and extent to the construction
   impacts, which would be temporary. Briefly, the filter installations would represent
   permanent modifications to existing buildings to address temporary construction
   impacts which would occur only during the first two years of construction, and not at
   peak emission levels throughout that period of time. Accordingly, the commenter’s
   suggestion was not adopted as a mitigation measure in the EIR.

3. Conduct an “Environmental Justice Community” preconstruction noise survey
   One commenter’s request for a preconstruction noise survey to be conducted in
   accordance with a program devised by the commenter was rejected on the basis that
   the EIR had already imposed sufficient mitigation to reduce construction noise
   impacts to less than significant, and additional mitigation is not warranted. Accordingly, the commenter’s suggestion was not adopted as a mitigation measure in
   the EIR.

4. Restrict all construction related traffic to off-peak hours
   Three comments suggested limiting large construction trucks to the off-peak
   commute periods. Chapter 2 of the FEIR (Responses to Comments) explained that no
   significant impacts were identified, and therefore mitigation is not required, and
   pointed out that the traffic management plan that would be prepared per the Port’s
   construction permit would minimize adverse traffic effects of the Project.
   Accordingly, the commenter’s suggestion was not adopted as a mitigation measure in
   the EIR. Nevertheless, the TMP has been incorporated into the MMRP, in a table that
   is separate and distinct from CEQA mitigation measures, for tracking and reporting
   purposes in order to ensure compliance with this project requirement during
   construction.

5. Revise MM AQ-1 to require more stringent emissions standards and MM AQ-2 to
   eliminate exemptions and require more stringent emissions standards
MM AQ-1 already requires a minimum of Level 3 VDECS on all diesel-powered construction equipment greater than 50hp beginning January 1, 2012, and allows for exemptions if equipment is not available meeting Tier 3 or Tier 4 levels before 2015 and accordingly the commenter’s suggestion was not adopted. MM AQ-2 has been revised to incorporate the commenters’ suggestions and requires that all trucks used in construction of the proposed Project meet model year 2010 on-road heavy-duty truck emission standards.

6. Require construction trucks to use the specific material supply locations assumed in the EIR.

The suggestion that haul trucks be required to use specific material supply locations in order to be consistent with the EIR’s assumptions was rejected as a mitigation measure because the truck trip distances assumed in the EIR are consistent with, and more conservative than, the URBEMIS model’s default assumptions. Accordingly, the analysis is consistent with CEQA and no additional mitigation is required.

7. Require unspecified mitigation for construction nighttime lighting on the PCH grade separation.

The FEIR did not identify a significant impact attributable to construction nighttime lighting; accordingly, mitigation is not required under CEQA.

8. Revise MM GHG-1 to remove the “when feasible” language regarding equipment idling.

The FEIR (See Chapter 2 Responses to Comments) explained that the qualification of feasibility is to permit idling of longer than five minutes duration only in those cases when it is infeasible to require equipment to shut down during that period of time for safety and operational purposes. Accordingly, the commenter’s suggestion was not adopted.

Zero Emissions Technologies

Numerous commenters suggested mitigation for air quality impacts in the form of various zero-emissions technology programs. These included converting PC AQ-11 (zero-emission demonstration program) into a mitigation measure; requests that undefined zero-emissions technologies be required; and requests that specific technologies such as electric, hydrogen fuel cell or hybrid trucks, zero-emissions locomotives, and the ZECMS technologies already being evaluated by the ports be required; and requests that the LAHD fund demonstration projects for locomotives and electrified rail systems. Chapter 2 of the FEIR (Responses to Comments and Master Response 7, ZECMS) pointed out that the technologies being requested do not exist in commercially available applications, and thus cannot be considered feasible. The master response provided details of the zero-emissions programs currently underway and described the technological and financial factors that make zero-emissions technologies infeasible for deployment as cargo movers in the port environment at this time. Accordingly, the commenters’ suggestions were not adopted as mitigation measures in the EIR.
On-Dock Railyards

One commenter requested that the EIR impose a mitigation measure that “commits to implementing any infrastructure projects needed to support on-dock rail capacities in the future, addresses operation matters to ensure on-dock rail at the Ports of Los Angeles and Long Beach are maximized before the proposed SCIG site is utilized, and includes mechanisms to ensure that use of on-dock occurs before near- and off-dock.” That request was rejected on two grounds. First, it would commit the proposed Project to building unspecified on-dock infrastructure projects, and such a commitment is impossible given that such projects would need to undergo their own environmental review processes (including projects that may not be within the jurisdiction of the lead agency to implement). Second, “operational matters” raised by the commenter are not within the lead agency’s authority to resolve; for example, the LAHD has no jurisdiction over labor rules and agreements.

Operational Emission Reduction Measures

Several commenters requested that MM AQ-8 be revised to incorporate more stringent emissions requirements for trucks or more aggressive implementation schedules. Regarding the requirement of “2010 trucks”, MM AQ-8 requires drayage trucks calling on the SCIG facility to meet an emission reduction in diesel particulate matter emissions (DPM) of 95% by mass relative to the federal 2007 on-road heavy-duty diesel engine emission standard (“low-emission” trucks). Regarding the implementation schedule, the schedule as proposed would reduce health risk impacts to less than significant under Impact AQ07 (see RDER Section 3.2.4.3). As such, no additional mitigation is necessary and the commenters’ suggestions were not adopted as mitigation measures in the EIR.

Commenters suggested that locomotives be required to meet US EPA Tier 4 locomotive standards on an accelerated schedule such that 100 percent of the linehaul locomotive fleet meet the Tier 4 standard by 2020. Accelerated introduction of Tier 4 locomotives cannot be considered feasible. Tier 4 locomotives are expected to utilize a new, untested technology that simply does not currently exist at a size adequate for line-haul locomotive engines. Under even the most optimistic scenario, there will only be a limited number of prototype high-horsepower Tier 4 locomotives operating in California for field testing in 2013. It is infeasible to commit in advance to purchase and deploy locomotives by a date certain when those locomotives have not yet been designed, tested, or deployed. Accordingly the commenters’ suggestions were not adopted as mitigation measures in the EIR.

Commenters suggested that the Advanced Locomotive Emission Control System (ALECS) be required. Although the ALECS system went through proof-of-concept testing on a limited scale at the Union Pacific (UP) Roseville Railyard as part of a multi-agency stakeholder process, the system was never scaled up to full implementation at a railyard as a result of a number of technical issues. Idling emissions were not determined to be a significant portion of total railyard emissions in the testing, and therefore a number of hoods and substantial range of extension would be needed to capture a reasonable fraction of emissions from multiple trains calling on a railyard. Idling emissions at SCIG are reduced through the use of Automatic Engine Start Stop (AESS) devices equipped on all linehaul locomotives, and therefore control of emissions from locomotive movement in the facility would require extensive overhead infrastructure to move the bonnet throughout the rail tracks on-site. This setup is not feasible given the physical constraints of the facility and the operation of live lifts. Accordingly the commenters’ suggestions were not adopted as mitigation measures in the EIR.
One comment suggested that MM AQ-10 be revised to impose firm deadlines for implementation of new technologies. The FEIR (Responses to Comments) explained that because the timing of approval and implementation is dependent on a number of factors beyond the LAHD’s control, it would not be feasible or effective to require implementation of MM AQ-10 within 12 months of a technology’s certification.

**Locomotive Restrictions**

One comment requested that the Project limit locomotive activity along the San Pedro Branch during times when children are expected to be outside. FEIR Chapter 2 (Responses to Comments) pointed out that limiting locomotive activity along the San Pedro Branch Line is not feasible because the SCIG facility would operate on a 24-hours-a-day, 7-days-a-week basis. Limiting locomotive activity would compromise the fluidity of operations that is at the heart of the expected increased efficiency of the Project and would affect throughput at SCIG, the Alameda Corridor, and throughout the network. In addition, since the RDEIR did not identify significant impacts associated with daytime locomotive activity along the San Pedro Branch, such mitigation would be inappropriate under CEQA (Pub. Resources Code §21002; CEQA Guidelines §15370; see generally Nollan v. California Coastal Commission, 483 U.S. 825, 834-37 (1987) and Dolan v. City of Tigard, 512 U.S. 374, 391 (1994)). Accordingly, the commenter’s suggestion was not adopted as a mitigation measure in the EIR.

Another comment suggested that the LAHD should require “Quiet Rail Zones” in the vicinity of the Project as mitigation, presumably for noise, and “in other areas of the LAHD as an offset to increased rail activity related to this project.” The FEIR (Responses to Comments) explained that the RDEIR did not identify a significant noise impact for operation of the facility that would be mitigated by a quiet rail zone, since the significant impacts were associated with on-site railyard operations and construction. In any case, as the FEIR noted, limiting locomotive activity would compromise the fluidity of operations that is at the heart of the expected increased efficiency of the Project and would affect throughput at SCIG, the Alameda Corridor, and throughout the network. Federal Railroad Administration (FRA) regulations for quiet zones cannot be imposed on railyard operations, only for public at-grade crossings; SCIG would not require the use of any public at-grade crossings in the ports area given that the South Lead Track would connect directly into the Alameda Corridor which is fully grade-separated. Accordingly, the commenter’s suggestion was not adopted as a mitigation measure in the EIR.

**Greenbelt Buffer and Landscaping**

Two commenters suggested that to mitigate traffic, air quality, and noise impacts the LAHD should implement the Terminal Island Reconfiguration and Parkway Mitigation Project, which would consist of a “de-intensification” of the Terminal Island Freeway north of PCH, turning it into a local street and greenbelt or buffer park. The project would include relocating the San Pedro Branch rail line and sculpting landforms on what is currently a freeway. Another commenter requested that the very similar “Yards” concept (see RDEIR Chapter 5) be implemented as a mitigation measure. The FEIR’s Chapter 2 (Responses to Comments) noted that the proposal would be beyond the Board of Harbor Commissioners’ authority to implement, as none of the land involved is owned or controlled by the LAHD. Furthermore, it would not mitigate traffic impacts because no traffic impacts along the freeway north of PCH were identified and in any case that segment of the freeway would not be used by SCIG trucks.

There is no evidence that the greenbelt proposed by the commenters would reduce the identified air quality impacts, which are attributable to emissions of mass pollutants. With
respect to GHG emissions the proposed greenbelt may result in offsets of some GHG emissions. With respect to noise, the FEIR explained that the identified unmitigated noise impacts would come from train activity, which the greenbelt proposal would not affect. Finally, the FEIR pointed out that the magnitude of the proposed mitigation measure is not sufficiently related to the impacts identified in the RDEIR, and it is not proportional in nature and extent to those impacts (Pub. Resources Code §21002; CEQA Guidelines §15370; see generally Nollan v. California Coastal Commission, 483 U.S. 825, 834-37 (1987) and Dolan v. City of Tigard, 512 U.S. 374, 391 (1994)). For these reasons, the proposed “Terminal Island Parkway Mitigation Project” is not an appropriate mitigation measure for the Project. Accordingly, the commenters’ suggestion was not adopted as a mitigation measure in the EIR.

One entity commenting on both the DEIR and the RDEIR suggested that additional vegetation and a landscaped berm should be installed to mitigate noise and light pollution, and that trees should be planted in all parking areas. Another comment suggested that under the Land Use section the EIR should provide for “additional project and LAHD boundary improvements, buffer, through the use of vegetation as a screen…” The FEIR (Responses to Comments) explained that the mitigation measures in the EIR (i.e., MM NOI-1 and MM NOI-3, sound walls, and MM NOI-2, construction noise control measures) would reduce both construction and operational noise. The commenters did not indicate how vegetation would reduce noise or what was intended by the term “boundary improvements”; and in any case the Project includes an area of intensive landscaping along the eastern side of the Project site. Accordingly, the commenter’s suggestion was not adopted as a mitigation measure in the EIR.

Lease Measures and Project Conditions

Commenters requested that the Lease Measures and Project Conditions in the EIR be adopted as mitigation measures and included in the MMRP. The FEIR (Responses to Comments) pointed out that the lease measures relate to practices and procedures required by existing laws and regulations for the handling, treatment, and disposal of soil and groundwater contamination encountered during construction. Compliance with existing laws and regulations is required under LAHD leasing requirements. The analysis in the RDEIR considered existing laws and regulations to be part of the project and found that impacts related to hazardous materials during construction would be less than significant and would not require mitigation. Accordingly, the commenter’s suggestion was not adopted as a mitigation measure in the EIR. Nevertheless, the lease measures have been incorporated into the MMRP, in a table that is separate and distinct from CEQA mitigation measures, for tracking and reporting purposes in order to ensure compliance with these lease measures during construction.

With regard to Project Conditions, the FEIR (Responses to Comments) points out that they are not required as CEQA mitigation measures but are important because they advance LAHD environmental goals and objectives. The Board may not elect to adopt some or all of those conditions, but any that are adopted will be enforceable and have been incorporated into the MMRP, in a table that is separate and distinct from CEQA mitigation measures, for tracking and reporting purposes. The project conditions are not feasible at this time and are not considered mitigation under CEQA to reduce an identified impact. For example, PC AQ-11 Zero Emission Technologies Demonstration Program specifies goals and lists the process by which zero emission technologies will be tested and pursued, but does not set fixed levels for zero emissions technology implementation until determined feasible in accordance with the criteria established in
PC AQ-11. PC AES-2 Compliance with Terminal Lighting Design Guidelines does not address an identified significant impact, but would help lessen any effects of lighting. Accordingly, it is not appropriate as a mitigation measure under CEQA.

Mitigation Grants Program

One comment urged the LAHD to establish a “Mitigation Grants Program” that would be used for a variety of community projects, including installing air filtration units and energy-efficient windows and doors for houses and positive exhaust ventilation for garages. The FEIR (Responses to Comments) pointed out that the proposed measure appears to be designed to provide general, public benefits, but is not specifically related to the proposed Project. In addition, the suggested mitigation grants program is presented at a conceptual level. Although the suggested program includes a generalized goal of reducing air quality impacts, it is not sufficiently developed to conclude that it would actually achieve reductions and thus represents improperly deferred mitigation for this Project. Accordingly, the commenter’s suggestion was not adopted as a mitigation measure in the EIR.

Public Health Measures

One commenter requested that the LAHD establish a “Public Health Care and Socio-Economic Mitigation Trust Fund” to “provide financial assistance for immediate, short term and long term health care and other negative socio-economic impacts.” The fund would pay a variety of health care, rehabilitation, retraining, and funeral costs for surrounding communities. The FEIR (Response to Comments) pointed out that it is highly speculative whether health care financial assistance would be effective in mitigating health impacts for which the Project is responsible, and the comment offers no facts or evidence that it would. Socio-economic program financial assistance would not mitigate any of the Project’s physical health effects. Therefore, there is no nexus between the Project impacts and the requested financial assistance for immediate, short-term, and long-term health care and socio-economic programs are not proposed as an RDEIR mitigation measure. In summary, the proposed fund is not sufficiently related to the impacts identified in the EIR, and is not proportional in nature and extent to those impacts.

Other commenters requested that the Project fund the construction of health care clinics, enclosed school lunch room facilities, and air filtration/conditioning systems. In these cases, too, it is highly speculative whether such measures would be effective in mitigating health impacts for which the Project is responsible (and which were not found to be significant), and the comments offers no facts or evidence that they would. Accordingly, the proposed measures are not sufficiently related to the impacts identified in the EIR, and are not proportional in nature and extent to those impacts, and are therefore not required under CEQA.

Truck Routes

Several comments suggested that the EIR include a mitigation measure that would require trucks to use only designated truck routes. The RDEIR is clear that use of the designated truck routes is considered part of the Project and would be monitored and enforced through the use of GPS devices installed in the trucks, in accordance with BNSF’s drayage contract requirements. This project feature is also described as part of mitigation measure MM AQ-8, Low Emission Drayage Trucks. Accordingly, the enforcement of designated truck routes through GPS devices is included in the MMRP converting a project feature into a mitigation measure is not required.
One commenter recommended that LAHD consider the commenter’s request for highway rule changes that would permit truck drayage of two or more piggy-back container trailers to/from the Project site, which would allow more containers to be transported by fewer trucks. The FEIR (Responses to Comments) explained that it is beyond the jurisdiction of the LAHD to request rule changes for truck drayage on highways; this issue is under the jurisdiction of Caltrans and the U.S. Department of Transportation. Accordingly the commenter’s suggestion would not be feasible and was not adopted as a mitigation measure in the EIR.

One commenter requested a mitigation measure requiring construction of a flyover from northbound TI Freeway to westbound PCH. The FEIR (Responses to Comments) explained the project would not have a significant impact on either (1) any intersections or (2) the freeway system. Accordingly, the suggested mitigation is not required under CEQA and was not adopted.

**Ultrafine Particles**

One commenter recommended that to mitigate the effects of ultrafine particles (UFP) the LAHD should:

- “Encourage use of after-treatment technologies combined with oxidation catalyst technology to produce concurrent benefit of ultrafine particle reduction.
- Encourage equipment and vehicle manufacturers to develop diesel particulate filters (DPF) with integrated controls for ultrafines since the additional cost may be relatively minor.
- Work with CARB, US EPA, and other stakeholders in conducting research studies and control strategy development efforts.
- When developing control measures for the reduction of PM10 and PM2.5, give consideration to reducing any undesired effects on ultrafine number emissions, where feasible.”

The FEIR, in Master Response 12, UFP, and Responses to Comments, explains that the proposed Project’s UFP emissions and their health impacts are speculative; therefore, mitigation measures specific to UFPs, such as the ones proposed in the comment, are not required. The FEIR did address the specific measures proposed by the commenter in the Responses to Comments, pointing out that 1) the trucks serving SCIG would already incorporate the after-treatment technologies mentioned in the comment, 2) that the LAHD has no authority to influence vehicle manufacturers given federal pre-emption, 3) that the Port is already working with regional and national stakeholders on developing emissions control strategies and technologies, and 4) that given the significant scientific uncertainty about emissions of UFPs and the effects of after-treatment control technologies, assessments of specific control measures with respect to UFP is speculative. Accordingly, the commenter’s suggestion was not adopted as a mitigation measure in the EIR.

**Greenhouse Gases**

Two commenters recommended that the Project consider purchasing carbon offsets and funding community projects such as solar panels to reduce GHG impacts to less than significant. The Project already includes solar panels on SCIG structures, and the FEIR (Responses to Comments) points out that the Project also includes a number of other GHG-reducing features such as LEED-certified buildings and electric cargo-handling cranes. The FEIR also cites the nine GHG mitigation measures in the RDEIR and points
out that the RDEIR includes a tenth measure, **MM GHG-10**, that requires BNSF to purchase a specified number of carbon offsets, corresponding to 100% of the Project’s electrical usage. Accordingly, the commenters’ suggested mitigation measure was adopted in the EIR.

### Noise Measures

One commenter requested that the LAHD establish an “Environmental Justice Community Fence-Line Monitoring Program” that would monitor in accordance with “Environmental Justice Community Noise Standards” developed by the commenter and that would be supervised by a “Community Advisory Committee” that would also be established by the LAHD. The stated purpose of the committee would be to “provide a forum to address DEIR, FEIR deficiencies, provide project statuses and address problems that may occur during construction and post operation”. The FEIR (Responses to Comments) pointed out that Mitigation Measure **MM NOI-2** already requires a Construction Noise Monitoring and Management Plan for the Project to address construction noise issues before, during, and after construction, and that full implementation of Mitigation Measures **MM NOI-1**, **MM NOI-2**, and **MM NOI-3** would reduce construction noise impacts to less than significant. Furthermore, the noise standards proposed by the commenter have not been adopted by the City of Long Beach, and thus would be inappropriate for application to the Project. Accordingly, the measures proposed by the commenter were rejected on the basis that they would be redundant to existing mitigation and inconsistent with CEQA.

Commenters also suggested that the EIR could include soundproofing as mitigation for noise impacts at schools. The FEIR (Chapter 2 Responses to Comments) pointed out that soundproofing was not warranted by the identified impacts, which do not occur at schools. Accordingly, mitigation in the form of soundproofing is not required under CEQA. Commenters also suggested that the EIR could include sound walls along all truck and trains transportation corridors, but the FEIR (Chapter 2 Responses to Comments) pointed out that installation of soundwalls along all truck and train transportation corridors was not warranted by the identified impacts. Commenters suggested that soundproofing could be used as an additional mitigation measure for residences experiencing a significant and unavoidable operational noise impact during the nighttime. As described in Section 4.2.6 of this document, the significant and unavoidable impact (NOI-6) would only be experienced by a receiver outdoors at night; accordingly soundproofing the interior of residences would not mitigate this impact.

Another commenter suggested that the 12-foot soundwall required by **MM NOI-1** should instead be a 24-foot-high wall. The FEIR (Chapter 2 Responses to Comments) points out that the 12-foot wall is appropriate given its distance from Project-related noise sources and geographic relationship to sensitive receivers, and that the wall in combination with the noise measures required under **MM NOI-2** would reduce impacts to less than significant. Accordingly, a 24-foot-high wall is not required as mitigation under CEQA.

### Environmental Justice

While not a CEQA Impact Section, the EIR includes an environmental justice analysis, provided for informational purposes only. Environmental justice is generally defined as the fair treatment and meaningful involvement of all people regardless of race, color, national origin, or income with respect to the development, implementation, and enforcement of environmental law, regulations and policies. In the context of project...
development, it refers to disproportionate adverse human health and environmental
effects on low income and minority populations (EPA; http://www.epa.gov/environmentaljustice/) and is a required assessment of federal
projects by federal agencies under the National Environmental Policy Act (NEPA).
is not a federal project, will not receive federal funds or federal permits, and, therefore,
NEPA does not apply.

Unlike NEPA, CEQA does not require an analysis of environmental justice issues. CEQA
requires that an EIR analyze physical impacts on the environment. A “significant effect
on the environment” means a substantial, or potentially substantial, adverse change in any
of the physical conditions within the area affected by the project, including land, air,
water, minerals, flora, fauna, ambient noise, and objects of historic or aesthetic
significance. An economic or social change by itself shall not be considered a significant
effect on the environment. A social or economic change related to a physical change may
be considered in determining whether the physical change is significant.” (CEQA
Guidelines §15382.)

Although not required under CEQA, the RDEIR includes a discussion of environmental
justice for informational purposes only (RDEIR Chapter 6). This approach is consistent
with LAHD’s goals to consider environmental justice in its policies and projects. The
RDEIR’s analysis of environmental justice did not consider disproportionate impacts, in
and of themselves, a physical impact on the environment. Under the methodology used
in this RDEIR’s analysis, if a significant unavoidable impact for any resource area would
impact low income or minority residents, it was identified as a disproportionate impact.
Because the proposed project’s eastern boundary is close to communities with a high
percentage of low income and minority populations, the RDEIR concluded that there
would be a disproportionate impact for the following resource areas: Aesthetics (AES-1),
Air Quality (AQ-1, AQ-2, AQ-4, AQ-7), Cultural Resources (CR-2), Land Use (LU-4),
and Noise (NOI-6).

Although the proposed Project would result in significant unavoidable impacts (project –
level and cumulative) to Greenhouse Gases, these impacts are not considered
disproportionate impacts to low income or minority populations.

Several commenters have stated that the SCIG project should not go forward because it
violates environmental justice principles. Those comments raise policy issues, not issues
related to the adequacy of the DEIR or RDEIR under CEQA. As stated above, CEQA
does not require an analysis of environmental justice. Therefore, no further response is
required because the comments do not raise any new significant environmental issues or
address the adequacy of the environmental analysis included in the RDEIR. (Pub.
Resources Code §21091(d); CEQA Guidelines §15204(a).) However, the following
response addresses comments that include inaccurate allegations relating to
environmental justice issues.

Many of the comments focus on the health impacts of locating the proposed project near
sensitive receptors. In fact, the health risk assessment (Section 3.2.4.3 and Appendix C3)
shows that health impacts will be less than significant for the surrounding communities.
Additionally, with the proposed SCIG project, operational mass pollutant emissions will
be reduced compared to baseline. (RDEIR Section 3.2.4.3) See also Master Response 11
(for Locating a Railyard Near Sensitive Receptors).
One commenter states that the construction and operation of SCIG will violate the civil rights of minority and low income persons under state and federal law. The LAHD strongly disagrees with all of these allegations and responds that they do not raise issues of deficiencies of the content of the RDEIR or DEIR under CEQA. Contrary to the assertion of the commenter, California Government Code § 11135 does not apply.

The commenter also alleges that approval of SCIG will violate federal law, citing Title VI of the Civil Rights Act of 1964, 42 U.S.C. §§2000d-2000d-7, Executive Order 12898, 49 C.F.R. 21.5(b)(3) and 49 C.F.R. 21.13. All of the cited sections of the federal law apply only to federally funded or assisted programs or federal actions. As stated above, the proposed SCIG project will not receive any federal funding; it will be built with 100 percent private funds from the applicant, BNSF Railway.

In summary, while the Port is concerned about, and the RDEIR addresses, environmental justice issues, they are not CEQA issues.

6 Alternatives to the Proposed Project

A total of 14 alternatives were considered in regards to how well each could feasibly meet the basic objectives of the Project and avoid or substantially lessen any of the significant effects of the project. Twelve of these alternatives were eliminated from detailed consideration either because they could not feasibly meet the basic objectives of the Project and/or because they would not avoid or substantially lessen any of the significant effects of the proposed Project, as discussed in Section 5 of the RDEIR. Two of the alternatives (in addition to the proposed Project) were carried forward for further analysis to determine whether they could feasibly meet most of the Project objectives but avoid or substantially lessen any of the significant effects of the project. These two alternatives are evaluated co-equally with the proposed Project for all environmental resources in Chapter 5 in the RDEIR. Chapter 5 of the RDEIR also compares the proposed Project and these two alternatives and identifies the environmentally superior alternative. The two alternatives that were carried through the analysis of impacts in Chapter 5 in conjunction with the proposed Project are:

• Alternative 1 – No Project Alternative
• Alternative 2 – Reduced Project Alternative

6.1 Reasonable Range of Alternatives

Under CEQA, lead agencies are required to evaluate a “reasonable range” of alternatives but are not required to evaluate every possible alternative. According to CEQA, “an EIR need not consider every conceivable alternative to a project” (CEQA Guidelines 15126.6(a)). The “range of alternatives required in an EIR is governed by a ‘rule of reason’ that requires an EIR to set forth only those alternatives necessary to permit a reasoned choice” (CEQA Guidelines § 15126.6(f)). The RDEIR contained two alternatives (three including the proposed Project), as shown in Table 4 below which provides variations in throughput, truck trips, and train trips compared to the proposed Project. The two alternatives plus the proposed Project constitute a reasonable range of alternatives, which permits the decision makers to make a reasoned choice regarding proposed Project approval (or approval of one of its alternatives), approval with modifications, or disapproval. Furthermore, CEQA does not require an EIR to consider multiple variations on the alternatives analyzed in an EIR. “What is required is the
production of information sufficient to permit a reasonable choice of alternatives so far as environmental aspects are concerned. (Village Laguna of Laguna Beach, Inc. v. Board of Supervisors of Orange County (1982) 134 Cal.App.3d 1022).

6.2 Alternatives Eliminated from Further Consideration

Alternatives that are remote or speculative, or the effects of which cannot be reasonably predicted, need not be considered (CEQA Guidelines, § 15126(f)(2)). Alternatives may be eliminated from detailed consideration in an EIR if they fail to meet most of the project objectives, are infeasible, or do not avoid any significant environmental effects (CEQA Guidelines, § 15126.6(c)). The following categories of alternatives were determined to be infeasible or were determined to not meet project objectives, and were eliminated from further consideration in the RDEIR (additional details regarding reasons for rejection are included in Chapter 5 of the RDEIR):

1. Alternate sites outside the two ports
2. Alternate sites inside the ports
3. Different layouts for the proposed facility
4. Different access to the site

6.3 Alternatives Analyzed in the EIR

Chapter 5 of the RDEIR contains a detailed comparative analysis of the alternatives that were found to achieve the project objectives, are considered ostensibly feasible, and may reduce environmental impacts associated with the proposed Project.

A summary of the impact analysis for the proposed Project and the Alternatives is shown in Table 5 below, which identifies the resource areas where the proposed Project or Alternatives would result in an unavoidable significant impact under CEQA, as discussed in resource analyses in Chapter 3 and Chapter 5 of the RDEIR. Detailed discussions of the resources with unavoidable significant impacts, significant impacts that can be mitigated to less than significant and less than significant impacts that can be further
reduced through incorporation of lease measures or project conditions of approval are provided in Chapter 5 of the RDEIR.

As shown on Table 5, the proposed Project and the two Alternatives have significant unavoidable impacts in the areas of Aesthetics, Air Quality and Meteorology, Cultural Resources, Greenhouse Gas Emissions and Climate Change, Land Use, Noise, Transportation, and Utilities and Public Services.

Table 5. Comparison of the Proposed Project and Alternatives Showing Significant and Unavoidable Impacts After Mitigation.

As shown in Table 5, the proposed Project and the alternatives have the same number of significant and unavoidable impacts, but not within the same resource areas. Therefore, the proposed Project and the alternatives were ranked by comparing the severity of these significant and unavoidable impacts within each resource area. The ranking is based on the significance determinations for each resource area, as discussed in Chapter 3 of the RDEIR, and reflects differences in the level of impact among the proposed Project and the alternatives.

(+1) = Impacts considered to be somewhat severe.
(+2) = Impacts considered to be moderately severe.
(+3) = Impacts considered to be substantially severe.

6.4 Environmentally Superior Alternative

As shown in Table 6, the Reduced Project Alternative has significant and unavoidable impacts that are less severe when compared to the proposed Project and the No Project Alternative and is therefore, the Environmentally Superior Alternative. The Reduced Project Alternative, by definition, has less activity than the proposed Project because this alternative’s operational capacity would be lower. The significant and unavoidable impacts that would be less severe include air quality (less operational emissions), GHG emissions (less operational emissions), and land use (fewer air quality impacts but noise impacts would likely be identical under peak conditions).

Although the proposed Project, Reduced Project and No Project Alternatives have the same number of significant and unavoidable impacts, the severity of the impacts differs. In addition, these impacts occur in different geographic locations: the proposed Project takes into consideration increased activity at the proposed Project site versus reduced activity on the I-710 and in the area of the downtown off-dock railyards. Greater use of rail under the proposed Project is contrasted with continued use of trucks for longer hauls under the Reduced Project and No Project Alternatives. The Environmentally Superior Alternative analysis above is a simplified way to look at these issues, but cannot substitute for a review of the analysis in the EIR itself.
6.5 Alternatives Suggested as Part of Public Comment on the DEIR and RDEIR

Numerous comment letters were received on both the DEIR and the RDEIR requesting that the Port analyze additional Alternatives or alternative project components to the proposed Project. Except as further described below, the recommendations fell into three categories:

- Maximize on-dock rail;
- Build the proposed Project “somewhere else,” which was generally suggested to be in the Port, and usually one or more of the locations considered in RDEIR Sections 5.1.3.1 and 5.1.3.2; and
- Incorporate Zero Emission Container Transport Technologies as an alternative transport system between the terminals and the Project. Technologies could include on-road electric vehicles, electric locomotives, or fixed guide way systems such as maglev.

Use of on-dock rail as an alternative was addressed in RDEIR Section 5.2.1 and in FEIR Chapter 2 (Master Response 5, Alternatives, and Master Response 6, On-Dock). Alternate Locations were addressed in RDEIR Section 5.1.3 and in FEIR Chapter 2 (Master Response 5, Alternatives). The use of alternate technologies was addressed in RDEIR Section 5.2.2 and in FEIR Chapter 2 (Master Response 7, ZECMS). The individual comments were all addressed in FEIR Chapter 2, Responses to Comments.

In four cases, commenters suggested alternatives that were not explicitly evaluated in the DEIR or RDEIR. Several commenters on the RDEIR suggested that the EIR consider the GRID (Green Rail Intelligent Design) concept, consisting of three parts: a new type of marine terminal that loads and unloads ships, including direct ship-to-train; an underground pipeline (the “Freight Pipeline”) containing an electrified rail line; and an inland port where containers would be sorted and distributed either to local-bound trucks or to eastbound trains. FEIR Chapter 2 (Master Response 5, Alternatives, and Master Response 7, ZECMS) pointed out that the GRID concept was even farther from demonstrated feasibility than the alternatives considered but rejected in RDEIR Chapter 5, and therefore was infeasible.

One comment suggested that the EIR consider a proposal to use a site in the Port of Long Beach currently leased by Toyota to build the Project. The alternative was rejected because no details of the proposal were provided in the comment and, to the LAHD’s knowledge, no such proposal has been made by the Port of Long Beach.

Several commenters suggested the EIR consider greenbelt concepts variously termed the “Terminal Island de-intensification project”, or “Alternative 3”. These concepts were rejected in responses to comments on the grounds that the LAHD has no authority to implement such a proposal and that it was not clear that there would be a sufficient nexus between the nature of a greenbelt and the nature of the Project’s impacts to justify such a massive project.

Finally, one comment suggested that the ICTF and the SCIG site be combined to form a “10,000-foot railyard.” This concept is not feasible due to economic and other factors. The ICTF facility is owned and operated by Union Pacific Railway Company. The proposed SCIG facility will be constructed and operated by BNSF. The two corporations...
are competitors and operate separate railyards and maintenance facilities and, in many instances, different tracks.

6.6 **CEQA Findings for Alternatives Analyzed**

LAHD has expressed its intent to promote increased use of rail in general, and near-dock rail facilities in particular, as indicated in its Rail Policy (Section 2.1.1 of RDEIR), and to comply with the Mayor of Los Angeles’ goal for the LAHD to increase growth while mitigating the impacts of that growth on the local communities and the Los Angeles region by implementing pollution control measures, including the elements of the CAAP specific to the proposed Project. Similarly, the California EPA has recommended the SCIG project as a preliminary candidate in the 2007 Goods Movement Action Plan, and the Southern California Association of Governments (SCAG) has identified the SCIG project as potentially playing a key role in addressing the growth of high-density truck traffic in its 2008 Regional Transportation Plan Goods Movement Report (SCAG, 2008) and the 2012 Regional Transportation Plan (SCAG, 2012).

The 2009 forecast estimates that total direct intermodal rail demand coming from the San Pedro Bay ports will be 15.7 million TEUs by the year 2035. This estimate assumes that, consistent with recent trends, direct intermodal will constitute 40 percent of the total San Pedro Bay container capacity of 39.4 million TEUs. Notwithstanding the planned and proposed improvements described in Section 1.1.5.3 of the RDEIR, on-dock railyard capacity, which is expected to reach a maximum of 11.7 million TEUs, will be unable to handle that intermodal demand.

Given the limitations of on-dock facilities and the demand for more efficient intermodal transport, the ports expect that near-dock and off-dock facilities will continue to be needed to satisfy the Ports’ future intermodal needs related to: (1) overflow traffic due to on-dock capacity constraints, (2) containers that require staging until a train going to the appropriate destination is available, and (3) transload cargo. For these reasons, the LAHD and the Port of Long Beach expect that near-dock and off-dock railyards will continue to handle a significant portion of the intermodal traffic.

6.6.1 **Project Objectives**

The following Project objectives were considered for the Alternatives analysis:

1. Provide an additional near-dock intermodal rail facility that would:
   a) Help meet the demands of current and anticipated containerized cargo from the various San Pedro Bay port marine terminals, and
   b) Combine common destination cargo “blocks” and/or unit trains collected from different San Pedro Bay Port marine terminals to build trains for specific destinations throughout the country.

2. Reduce truck miles traveled associated with moving containerized cargo by providing a near-dock intermodal facility that would:
   a) Increase use of the Alameda Corridor for the efficient and environmentally sound transportation of cargo between the San Pedro Bay Ports and destinations both inland and out of the region, and
   b) Maximize the direct transfer of cargo from port to rail with minimal surface transportation, congestion and delay.
3. Provide shippers carriers, and terminal operators with comparable options for Class 1 railroad near-dock intermodal rail facilities.

4. Construct a near-dock intermodal rail facility that is sized and configured to provide maximum intermodal capacity for the transfer of marine containers between truck and rail in the most efficient manner.

6.6.2 No Project Alternative (Alternative 1)

Under Alternative 1, the No Project Alternative, the LAHD would not issue any permits or discretionary approvals associated with the proposed Project, the proposed Project would not be built, and existing uses and operations by current businesses at the Project site would remain at the site. As it is reasonable to expect that existing uses would experience some growth in the future, despite site constraints, the No Project alternative assumes a 10 percent growth in activity levels of the existing uses at the Project site by 2016, and then remains at 2016 levels for all future years due to site configuration and size as well as future growth projections.

Forecasted increases in cargo throughput at the two San Pedro Bay Ports, including intermodal cargo, would still occur. BNSF has represented that, in the No Project Alternative, the additional intermodal cargo (direct intermodal, transloaded, and domestic) would be handled at the Hobart/Commerce Railyard, east of downtown Los Angeles, approximately 24 miles north of the San Pedro Bay Ports (BNSF, 2012). By 2035, the year of full operation for the Reduced Project and the proposed Project, the No Project Alternative analysis assumes that BNSF would handle approximately 2.0 million direct intermodal TEUs from the ports per year. Physical modification and operational changes would be undertaken at Hobart Yard in order to accommodate the increased cargo. BNSF would re-organize its Southern California operations to handle primarily international (i.e., port) cargo at Hobart and shift the domestic cargo currently occupying a share of Hobart’s capacity to other regional intermodal facilities. The operational changes and the approved expansions would allow Hobart/Commerce to handle approximately 3 million lifts (5.4 million TEUs) per year by 2035, which is approximately 1 million lifts more than its existing capacity. The Port independently undertook engineering analyses of the Hobart/Commerce Yard that confirmed BNSF’s representations of the potential to expand capacity at these facilities (AECOM, 2012).

Drayage trucks that would operate between the marine terminals and the SCIG facility under the proposed Project would instead continue to operate between the marine terminals and the Hobart/Commerce Yard. Accordingly, the No Project Alternative would result in 212 additional truck trips on I-710 above the baseline per average day between the Project site and the Hobart/Commerce Yards in each direction in 2023 and increasing to 3,751 additional trips per day in 2035 and thereafter (see RDEIR Section 5.4.1). Because of the distance to the Hobart/Commerce Yard, each trip would be approximately 20 miles longer in each direction than under the proposed Project. Similarly, no line-haul train trips would occur between the Project site and the Hobart/Commerce Yards. However, there would continue to be limited onsite locomotive activity associated with existing California Cartage and L.A. Harbor Grain Terminal operations.
Train, truck, and equipment activity within the Hobart/Commerce Yards is not analyzed in this document for the No Project Alternative. Those activities are accounted for in the environmental analyses conducted under the CARB Memorandum of Understanding with BNSF. This assumption is conservative, as it avoids the possibility of overstating impacts of the No Project Alternative. BNSF represents that the expansion of Hobart/Commerce Yards will occur whether or not SCIG is constructed; the difference would be whether the facility would handle primarily domestic and transloaded cargo (if SCIG is built) or a mixture of domestic, transloaded, and international cargo (if SCIG is not built).

**Finding**

The Board hereby finds that the No Project Alternative (Alternative 1) would not meet any of the Project Objectives, and on that basis, rejects the No Project alternative.

**Facts in Support of Finding**

When compared against the CEQA baseline, the No Project Alternative would result in six fewer significant and unavoidable environmental impacts compared to the proposed Project. These impacts include AES-1, AQ-1, AQ-2, CR-2, LU-4, and NOI-6 because the Project construction would not occur at all. However, Alternative 1 would result in seven more significant and unavoidable environmental impacts compared to the proposed Project. These impacts are AQ-3, AQ-7, AQ-8, GHG-2, LU-2, TRANS-4, and PS-6.

The No Project would lead to increased truck trips to the Hobart/Commerce yards and the projected truck traffic primarily on the I-710 freeway would lead to air pollutant and greenhouse gas emissions impacts and localized pollutant concentration and health risk impacts. The No Project Alternative would conflict with air quality plans and objectives, by not increasing the efficiency of goods movement through increasing the use of rail to move cargo. Increased freeway congestion along the I-710 associated with trucks traveling to the Hobart/Commerce yards in the No Project Alternative would constitute a new transportation impact. The No Project Alternative would result in a significant and unavoidable impact under Land Use due to inconsistency with the General Plan or adopted environmental goals or policies contained in other applicable land use plans adopted for the purpose of avoiding or mitigating an environmental impact. This Land Use impact results from the significant and unavoidable environmental impacts in various environmental resource areas, because no mitigation is feasible as no discretionary actions under CEQA would occur. Finally, the No Project Alternative would result in increased generation of solid waste from activities at the Project site, and because area landfills are already at capacity and no mitigation is feasible for the No Project Alternative, this would constitute a significant and unavoidable impact.

In total, the No Project Alternative would result in one more unavoidable significant adverse impact compared to the proposed Project. The No Project would involve no discretionary actions subject to CEQA, would not construct a new near-dock facility, and would involve the continued drayage of international cargo containers by truck between the San Pedro Bay Ports’ terminals and the Hobart/Commerce Yards in downtown Los Angeles. The No Project Alternative therefore does not meet the goal of constructing a new, near-dock railyard to meet the demands of current and anticipated containerized cargo from the various San Pedro Bay port marine terminals, and to combine common destination cargo blocks and/or unit trains collected from different San Pedro Bay Port marine terminals to build trains for specific destinations throughout the country. In the No Project, containers drayed by truck from the marine terminals to Hobart/Commerce Yards would travel approximately 20 miles longer by truck each one-way trip as
compared to the Project, therefore the No Project would not reduce truck miles traveled by international cargo or enhance the use of the Alameda Corridor. By not constructing a new, near-dock facility, shippers, carriers, and terminal operators would not be provided with comparable options for Class 1 railroad near-dock intermodal rail facilities. The improvements in the efficiency of cargo handling and transfer to rail associated with the proposed Project would not be achieved in the No Project, and thus the No Project does not further the goals of the Port and the California Goods Movement Action Plan. For these reasons, the No Project Alternative is not considered to be a viable Project alternative that could achieve the project objectives.

Thus, based on the analyses in Chapter 3 and Chapter 5 of the RDEIR, the No Project Alternative would result in one more environmental impact compared to the proposed Project and would not meet the overall project purpose or objectives under CEQA.

6.6.3 Reduced Project Alternative (Alternative 2)

Under Alternative 2, the Reduced Project Alternative, the SCIG facility and facilities on the alternate business sites described in the proposed Project would be constructed, but SCIG’s activity level would be limited by lease conditions, rather than on economic demand or cargo activity. The disposition of the existing businesses would be the same as described for the proposed Project. While a reduced project alternative would normally be considered to have a smaller footprint, thereby requiring less construction, in this case BNSF has represented that the physical and operational requirements of modern intermodal rail operations dictate a minimum size to a near-dock or off-dock facility. For example, 4,000-foot tracks with switch leads at both ends are required in order to handle efficiently the typical 8,000-foot intermodal train. The facility must have adequate on-site space for truck queuing and container stacking, and it must be readily accessible from major regional roads and highways. BNSF represents that the proposed Project is the minimum size that can be operated efficiently and economically. Accordingly, all physical features of the Reduced Project Alternative would be the same as the proposed Project, including the railyard features (trackage, cranes, buildings, and roads) and the off-site improvements to roads and trackage. The construction methods and schedule would be the same as those of the proposed Project (Section 2.4.3 of the RDEIR). Thus, construction costs would not be materially less for the Reduced Project Alternative than for the proposed Project. At substantially the same total investment as the proposed Project, the Reduced Project Alternative would not allow BNSF enough cargo throughput to make such an investment economically justifiable based on the returns it would generate. Therefore, BNSF has advised that it would not build the Reduced Project at this time.

At full operation, the Reduced Project would handle approximately 1.85 million TEUs per year (instead of the 2.8 million TEU associated with the proposed Project), and it is anticipated it would reach capacity in 2035. Those containers would be transported by 2,160 trains (6 round trips per day) and approximately 1.33 million one-way truck trips per year. The operational details of the facility would be largely the same as those of the proposed Project, although the facility might only operate two shifts per day to handle the reduced throughput. Because of the reduced cargo capacity of the Reduced Project Alternative, the remaining cargo demand not handled by the SCIG facility under the Reduced Project Alternative would continue to be handled at Hobart/Commerce or other railyards such as the UP ICTF. This assumption is based on the projections of regional intermodal demand and the market share of that demand handled by both Class I
Finding

The Board hereby finds that although Alternative 2 would result in reduced environmental impacts compared to the proposed Project, Alternative 2 would not fully meet the project objectives of “...meeting current and anticipated containerized cargo demands...”, would not fully meet the basic Project objective of “reducing the truck trips and total truck mileage.” Additionally, Alternative 2 would not fully meet the following specific project objectives: (1) “Provide an additional near-dock intermodal rail facility that would: a) Help meet the demands of current and anticipated containerized cargo from various San Pedro Bay port marine terminals,(2) “Reduce truck miles traveled associated with moving containerized cargo by providing a near-dock intermodal facility that would...3) Maximize the direct transfer of cargo from port to rail with minimal surface transportation, congestion and delay”, (4) “construct a near-dock intermodal rail facility that is sized and configured to provide maximum intermodal capacity of the transfer of marine containers between truck and rail in the most efficient manner”. As a result, the Board finds that Alternative 2 is not a feasible alternative to the proposed Project, in that it would not accomplish fundamental Project goals and objectives. The Board finds Alternative 2 infeasible for all of the individual and cumulative reasons described above.

Facts in Support of the Finding

When compared against the CEQA baseline, Alternative 2 would result in the same significant and unavoidable environmental impacts compared to the proposed Project. Because its operational capacity would be lower, Alternative 2 would result in less severe impacts related to Air Quality and Meteorology, Greenhouse Gases and Climate Change, Land Use and Noise. Significant and unavoidable impacts for Aesthetics and Cultural Resources would be identical in the Reduced Project as in the Project because construction of the SCIG facility and its physical features would be identical in the Reduced Project and Project. Further, whether the throughput levels are at the proposed Project level or the Reduced Project Alternative level, access to and from the Alameda Corridor will be via an underpass under the Pacific Coast Highway (PCH) at the south end of the facility. Therefore, in either scenario, the existing underpass will have to be widened to accommodate the leads into the facility. Similarly, as it is necessary for congestion prevention to separate SCIG truck traffic from general area traffic, dedicated on/off-ramps to/from PCH will also have to be built, regardless of throughput levels. In addition, existing underground utilities will have to be relocated into a utility trench to be constructed or protected in place under both the proposed Project and the Reduced Project Alternative. The reconstruction of the Dominguez Channel Bridge also will be required in either scenario because the operating rules of the Alameda Corridor require sufficient lead lengths so that no switching activity occurs on the Corridor. The existing Dominguez Channel rail bridge is not wide enough accommodate the second lead necessary to permit switching trains in and out of a yard with 4000 foot tracks without intruding on the Corridor. Additionally, the Sepulveda Blvd Rail Bridge will also need to be rebuilt under either scenario because it presently cannot accommodate the additional track required at the north end of the yard. Two south end lead tracks are required under either scenario to allow trains to arrive and depart simultaneously, which often is required for efficient cargo operations. To achieve two south end lead tracks, BNSF would have...
to build the same number of track modules inside the yard under the Project or the Reduced Project Alternative. Because BNSF would be building the same number of modules, the amount of mast lighting to be installed also would be the same. Under both scenarios, in order to prevent trucks from queuing on PCH, the 2,500 foot queuing lane would have to be built, as would the full automated gate checkpoint system for safety and security. The power supply for the facility also would be the same in either scenario due to the number of cranes under the proposed Project and the Reduced Project Alternative. Finally, the impacts associated with the displacement of the existing tenants would be the same under both scenarios. All of these things are major cost elements of the development of the facility. Thus, construction costs would not be materially less for the Reduced Project Alternative than for the proposed Project. At substantially the same total investment as the proposed Project, the Reduced Project Alternative would not allow BNSF enough cargo throughput to make such an investment economically justifiable based on the returns it would generate. Therefore, BNSF has advised that it would not build the Reduced Project at this time.

6.6.4 Summary

Based on the alternatives discussion provided in the FEIR and the information above, the Board determines the proposed Project is the feasible alternative that, when taking into account environmental and economic factors, best meets project objectives of meeting the demands of current and anticipated containerized cargo; reducing truck miles traveled associated with cargo movement by maximizing transport from directly port to rail; providing shippers carriers, and terminal operators with comparable options for Class 1 railroad near dock intermodal rail facilities; constructing a near-dock intermodal rail facility that is sized and configured to provide maximum intermodal capacity for the transfer of marine containers between truck and rail in the most efficient manner; and providing infrastructure improvements consistent with the California Goods Movement Action Plan.

6.6.4.1 Findings Regarding Other CEQA Considerations

**Significant Irreversible Environmental Changes**

Irreversible and irretrievable environmental changes caused by a Project include uses of nonrenewable resources during construction and operation, long-term or permanent access to previously inaccessible areas, and irreversible damages that may result from project-related accidents.

**Finding and Rationale**

The proposed Project would require the use of nonrenewable resources to develop the site for Port-related activities. Fossil fuels and energy would be consumed during both the construction and the operational phases. These energy resources would for the most part be irretrievable, and would cause irreversible changes in supplies of fossil fuel available for other uses. However, some electricity provided by SCE and the LADWP is provided from renewable sources and recently adopted legislation raises California’s renewable portfolio requirements for retail electricity sales.

Non-recoverable material resources committed to the proposed Project other than fossil fuels would include: capital, labor, and construction materials such as rock, steel, concrete, and timber. Non-recoverable materials would be used during construction and operational activities, but the amounts needed would be accommodated by existing
supplies. Although the increase in the amount of materials used would be limited, they would be unavailable for other uses. The irreversible changes discussed above are justified by the increased efficiency in cargo handling at the Port that the proposed Project would provide, as well as the environmental benefits in comparison to the No Project Alternative.

7 Statement of Overriding Considerations

Pursuant to § 15093 of the CEQA Guidelines, the Board must balance the benefits of the proposed Project against unavoidable environmental risks in determining whether to approve the project. The proposed Project would result in significant unavoidable impacts to Aesthetics, Air Quality, Cultural Resources, Greenhouse Gases, Land Use and Noise. The proposed Project would also result in a cumulatively considerable contribution to significant cumulative impacts to Aesthetics, Air Quality, Cultural Resources, Greenhouse Gases, Land Use, Noise, and Utilities & Public Services.

7.1 Aesthetics and Visual Resources

The proposed Project would have a significant aesthetic impact related to demolition of the historic Sepulveda Boulevard railroad bridge (Impact AES-1). Mitigation is available but would not reduce this impact to less than significant. Accordingly, impacts after mitigation would remain significant and unavoidable.

As provided in the Findings above, there will also be a cumulative aesthetics impact (Cumulative Impact AES-1) that will remain significant and unavoidable.

7.2 Air Quality and Meteorology

The proposed Project would result in significant unavoidable impacts to air quality during construction and operation even with the adoption and implementation of mitigation measures. Specifically, VOC, CO, NOx, PM_{10}, and PM_{2.5} emissions related to construction would exceed SCAQMD thresholds (Impact AQ-1). Project construction would also result in offsite ambient air pollutant concentrations that exceed the SCAQMD threshold of significance (Impact AQ-2) for PM_{10} and NO_{2}.

Project operation would result in offsite ambient air pollutant concentrations that exceed the SCAQMD threshold of significance (Impact AQ-4) for NO_{2}, PM_{10}, and PM_{2.5}.

As provided in the Findings above, there will also be cumulative air quality construction and operational impacts (see Cumulative Impact AQ-1, Impact AQ-2, Impact AQ-4, and Impact AQ-7) that would remain significant and unavoidable. Additionally, emissions from operation of the proposed Project would make a cumulatively considerable contribution to an existing significant cumulative impact for CO (Cumulative Impact AQ-3).

7.3 Cultural Resources

Construction of the proposed Project would results in a significant and unavoidable impact (Impact CR-2) even after mitigation because the Sepulveda Blvd rail bridge, a historical structure would be demolished.
As provided in the Findings above, there will also be a cumulative cultural impact (Cumulative Impact CR-2) that would remain significant and unavoidable.

### 7.3 Greenhouse Gas Emissions and Climate Change

Because there are no established significance thresholds for GHG emissions, the Port has established that any increase is potentially significant. Construction and operation (year 2035 and beyond) of the proposed Project would result in significant and unavoidable impacts to GHG emissions (Impact GHG-1).

As provided in the Findings above, there will also be a cumulative GHG impact (Cumulative Impact GHG-1) that would remain significant and unavoidable.

### 7.4 Land Use

The proposed Project would cause significant air quality and noise impacts. Therefore, secondary impacts on land use (Impact LU-6) would be considered significant and unavoidable because mitigations would not reduce the impacts to less than significant.

As provided in the Findings above, there will also be a cumulative land use impact (Cumulative Impact LU-4) that would remain significant and unavoidable.

### 7.5 Noise

With implementation of mitigation measures, construction equipment noise and daytime operations noise generated by the proposed Project would be reduced to less than significant level. However, nighttime operations noise with mitigation would remain a significant and unavoidable impact (Impact NOI-6)

As provided in the Findings above, there will also be a cumulative noise impact (Cumulative Impact NOI-6) that would remain significant and unavoidable.

### 7.6 Utilities and Public Services

As provided in the Findings above, there will be a cumulative impact regarding the future of landfill capacity and waste reduction in the region (Cumulative Impact PS-6) that would remain significant and unavoidable.

### 7.7 Project Benefits

The proposed Project offers several benefits that outweigh the unavoidable adverse environmental effects of the project. The Board of Harbor Commissioners adopts the following Statement of Overriding Considerations. The Board recognizes that significant and unavoidable impacts will result from implementation of the Project, as discussed above. Having (i) adopted all feasible mitigation measures, (ii) rejected as infeasible any alternatives which would avoid or reduce the significant impacts of the proposed Project, as discussed above, (iii) recognized all significant, unavoidable impacts, and (iv) balanced the benefits of the Project against the Project’s significant and unavoidable
impacts, the Board hereby finds that the benefits outweigh and override the significant
unavoidable impacts for the reasons stated below.

The below stated reasons summarize the benefits, goals, and objectives of the proposed
Project and provide the rationale for the benefits of the Project. These overriding
considerations justify adoption of the Project and certification of the completed FEIR.
Many of these overriding considerations individually would be sufficient to outweigh the
adverse environmental impacts of the Project. These benefits include the following:

- **Fulfills Port legal mandates and objectives.** The proposed Project would fulfill
LAHD’s intent to promote increased use of rail and near-dock facilities, which would
help meet the demands of current and anticipated containerized cargo from the San
Pedro Bay ports and provide space to collect and combine cargo units bound for
common destinations to be transported by rail. Rail is an environmentally sound and
efficient mode of transportation that can reduce truck miles traveled on roads
associated with cargo transport, thereby reducing congestion, delay, and air pollutant
emissions. The proposed Project would be a Class 1 facility servicing shipper
carriers and terminal operators. Its near-dock location is configured to handle
projected growth in containerized cargo throughput and to make efficient use of truck
and trail transport.

- **Removes truck trips on I-710.** Removes approximately 95 percent of intermodal
drayage truck trips per year off the I-170 Freeway that would have traveled 24 miles
from the marine terminals to the BNSF Hobart/Commerce Yard in downtown Los
Angeles, thereby reducing truck emissions and congestion.

- **Increases use of the Alameda Corridor.** The trains utilizing the SCIG facility
would increase the use of the Alameda Corridor for the efficient and environmentally
sound methods of transporting cargo between the San Pedro Bay Ports and
destination both inland and out of the region.

- **Implements the San Pedro Bay Clean Air Action Plan (CAAP).** The Project
incorporates many environmental features consistent with the CAAP, and additional
mitigation measures, lease measures and project conditions have been identified
through the CEQA findings of the DEIR/RDEIR that meet CAAP requirements and
objectives.

- **Provides new jobs during the life of the Project.** Operation of the proposed Project
will create approximately 1,096 direct and indirect long term jobs by 2046. Annual
pay for direct, indirect and induced jobs is estimated to exceed $73,500 per job/per
year.

- **Provides new construction jobs.** Project construction would generate approximately
1,500 direct and indirect jobs per year for the three-year construction period.
Aggregate wages during the three-year construction period for direct and secondary
jobs would be about $39.4 million annually (2010 dollars), which averages
approximately $46,600 per job per year. In addition, qualified local residents would
be given priority for all new job offers at SCIG.

- **The Project would provide tax revenues.** Annual tax revenues contributed from
construction would reach $31.4 million over the three-year construction period.
Annual tax revenues contributed from operation would reach $14.6 million at full
capacity by 2035.
The Project helps achieve California and Regional Goods Movement Planning

Goals. The California Environmental Protection Agency and California’s Business
Transportation and Housing Agency (which includes Caltrans) has recommended the
SCIG Project as a preliminary candidate in the 2007 Goods Movement Action Plan
which states “The completion of the Union Pacific Intermodal Container Transfer
Facility (ICTF) and the proposed Southern California International Gateway (SCIG)
BNSF Railyard are two infrastructure projects that would help to move container
traffic from truck to rail.” The Southern California Association of Governments
(SCAG) has identified the SCIG Project as potentially playing a key role in
addressing the growth of high-density truck traffic in its 2008 Regional
Transportation Plan Goods Movement Report and in the 2012-2035 Regional
Transportation Plan (RTP). In addition, SCAG’s public comment letter on the Draft
RTP/SCS includes the proposed project as a component of the comprehensive goods
movement system.”

In summary, the Project will allow the Port to meet its legal mandates to accommodate
growing international commerce, will permit LAHD to continue to comply with the
CAAP and other measures designed to reduce overall emissions over time, and provide
jobs to the local economy. The Board hereby finds that the benefits of the proposed
Project described above outweigh the significant and unavoidable environmental effects
of the project, which are therefore considered acceptable.

8.0 Location and Custodian of Records

The documents and other materials that constitute the administrative record for the
LAHD’s actions related to the Project are located at the office of the Director of
Environmental Management, Los Angeles Harbor Department, 222 W. 6th Street, 10th
floor, San Pedro, California 90731.
